der zweckmäßigen Vergleichstherapie nach § 35a
SGB V**

**Vorgang: 2018-B-025
(Fluticasonfuroat/Umeclidinium/Vilanterol)**

Stand: April 2018

<p style="text-align: center;">Umeclidinium-Vilanterol-Fluticason zur Behandlung der COPD</p>	
<p style="text-align: center;">I. Zweckmäßige Vergleichstherapie: Kriterien gemäß 5. Kapitel § 6 VerfO G-BA</p>	
<p>Kriterien gemäß 5. Kapitel § 6 VerfO</p>	
Sofern als Vergleichstherapie eine Arzneimittelanwendung in Betracht kommt, muss das Arzneimittel grundsätzlich eine Zulassung für das Anwendungsgebiet haben.	siehe Abschnitt II. Zugelassene Arzneimittel im Anwendungsgebiet COPD
Sofern als Vergleichstherapie eine nicht-medikamentöse Behandlung in Betracht kommt, muss diese im Rahmen der GKV erbringbar sein.	Nicht angezeigt
Beschlüsse/Bewertungen/Empfehlungen des Gemeinsamen Bundesausschusses zu im Anwendungsgebiet zugelassenen Arzneimitteln/nicht-medikamentösen Behandlungen	<p>Änderung der Arzneimittel-Richtlinie, Anlage XII: Beschlüsse über die Nutzenbewertung von neuen Arzneimitteln nach § 35a SGB V</p> <ul style="list-style-type: none"> - Fluticasonfuroat/Vilanterol (Beschluss vom 20.03.2014) - Indacaterol/Glycopyrronium (Beschluss vom 08.05.2014) - Olodaterol (Beschluss vom 17.07.2014) - Tiotropium/ Olodaterol (Beschluss vom 04.02.2016) - Umeclidinium/Vilanterol (Beschluss vom 08.01.2015) - Aclidiniumbromid/Formoterol (Beschluss vom 16.07.2015) - Aclidiniumbromid (erneute Nutzenbewertung, Beschluss vom 07.04.2016) - Umeclidinium (Beschluss vom 21.07.2016) <p>IQWiG Abschlussbericht</p> <ul style="list-style-type: none"> - Tiotropiumbromid (IQWiG Bericht A05-18 vom 26.06.2012)
Die Vergleichstherapie soll nach dem allgemein anerkannten Stand der medizinischen Erkenntnisse zur zweckmäßigen Therapie im Anwendungsgebiet gehören.	siehe systematische Literaturrecherche

II. Zugelassene Arzneimittel im Anwendungsgebiet COPD

Wirkstoff ATC-Code Handelsnam e	Anwendungsgebiet (Text aus Fach-/Gebrauchsinformation)
Zu bewertendes Arzneimittel:	
Umeclidinium- Vilanterol- Fluticasone ATC-Code noch nicht zugewiesen Trelegy Ellipta	<p><u>zugelassenes Anwendungsgebiet:</u> Trelegy Ellipta ist angezeigt für die Erhaltungstherapie bei erwachsenen Patienten mit moderater bis schwerer chronisch obstruktiver Lungenerkrankung (COPD), die mit einer Kombination aus einem inhalativen Kortikosteroid und einem langwirksamen Beta-2-Agonisten nicht ausreichend eingestellt sind (zu den Wirkungen hinsichtlich Symptomkontrolle siehe Abschnitt 5.1)</p> <p><u>geplante Type-II-Variation:</u> Trelegy Ellipta ist angezeigt für die Erhaltungstherapie bei erwachsenen Patienten mit moderater bis schwerer chronisch obstruktiver Lungenerkrankung (COPD) zur Symptomlinderung und zur Reduktion von Exazerbationen (siehe Abschnitt 5.1).</p>
SABA: Selektive Beta2-Adrenozeptor-Agonisten, kurzwirksame	
Beispielhaft Salbutamol R03AC02 generisch	Zur Verhütung und Behandlung von Atemwegserkrankungen mit reversibler Obstruktion, wie z. B. Asthma bronchiale oder chronische Bronchitis. <i>Hinweis: Eine längerfristige Behandlung soll symptomorientiert und nur in Verbindung mit einer entzündungshemmenden Dauertherapie erfolgen.</i>
LABA: Selektive Beta2-Adrenozeptor Agonisten, langwirksame	
Salmeterol R03AC12 generisch	Zur Langzeitbehandlung von Atemwegserkrankungen mit Verengung der Atemwege durch Krämpfe der Bronchialmuskulatur (obstruktive Atemwegserkrankungen), wie z. B. Asthma bronchiale (anfallsweise auftretende Atemnot durch Atemwegsverkrampfung, insbesondere nächtliches Asthma), chronische Bronchitis und Blählinge (Lungenemphysem).
Formoterol R03AC13 generisch	Prophylaxe und Behandlung der Bronchokonstriktion bei Patienten mit reversibler oder irreversibler COPD einschließlich chronischer Bronchitis und Emphysem.

II. Zugelassene Arzneimittel im Anwendungsgebiet COPD

Wirkstoff ATC-Code Handelsnam e	Anwendungsgebiet (Text aus Fach-/Gebrauchsinformation)
Indacaterol R03AC18 Onbrez®	Onbrez® Breezhaler® ist für die bronchialerweiternde Erhaltungstherapie der Atemwegsobstruktion bei Erwachsenen mit chronisch-obstruktiver Lungenerkrankung (COPD) angezeigt. (Onbrez® Breezhaler®, Oktober 2014)
Olodaterol R03AC19 Striverdi® Respimat®	Striverdi Respimat ist indiziert als Bronchodilatator zur Dauerbehandlung bei chronischer obstruktiver Lungenerkrankung (COPD). (Striverdi® Respimat®, November 2013)
SAMA: Anticholinergika, kurzwirksame	
Ipratropiumbr omid R03BB01 generisch	Ipratropiumbromid wird zur Therapie von reversiblen Bronchospasmen in Zusammenhang mit chronisch obstruktiver Lungenerkrankung (COPD) eingesetzt.
LAMA: Anticholinergika, langwirksame	
Tiotropiumbro mid R03BB04 Spiriva® Respimat®	Tiotropium ist indiziert als dauerhaft einzusetzender Bronchodilatator zur Befreiung von Symptomen bei chronischer obstruktiver Lungenerkrankung (COPD).
Aclidiniumbro mid R03BB05 Bretaris/Eklira Genuair®	Bretaris® Genuair® bzw. Eklira® Genuair® werden als bronchodilatatorische Dauertherapie zur Befreiung von Symptomen bei Erwachsenen mit chronisch-obstruktiver Lungenerkrankung (COPD) angewendet.
Umeclidinium bromid	Incruse® ist für die bronchialerweiternde Erhaltungstherapie zur Symptomlinderung bei erwachsenen Patienten mit chronisch obstruktiver Lungenerkrankung (COPD) angezeigt.

II. Zugelassene Arzneimittel im Anwendungsgebiet COPD	
Wirkstoff ATC-Code Handelsnam e	Anwendungsgebiet (Text aus Fach-/Gebrauchsinformation)
R03BB07 Incruse®	
Glycopyrroniumbromid R03BB06 Seebri® Breezhaler®	Seebri® Breezhaler® ist für die bronchialerweiternde Erhaltungstherapie zur Symptomlinderung bei erwachsenen Patienten mit chronisch-obstruktiver Lungenerkrankung (COPD) angezeigt.
Xanthine	
Beispielhaft Theophyllin R03DA04 generisch	Bronchospasmolytikum/Antiasthmatisches: Behandlung und Verhütung von Atemnotzuständen aufgrund von Verengung der Atemwege (Bronchokonstriktion) bei Patienten mit persistierendem Asthma bronchiale oder mittel- bis schwergradiger obstruktiver Atemwegserkrankung (z. B. chronische Bronchitis und Lungenemphysem). <i>Hinweis: Es wird empfohlen die Dauertherapie dieser Erkrankungen mit Theophyllin in Kombination mit anderen, die Bronchien erweiternden und entzündungshemmenden Arzneimitteln, wie z. B. lang wirksamen β-Sympathomimetika und Glukocortikoiden durchzuführen. Arzneimittel mit verzögerter Theophyllin-Freisetzung, wie Theophyllin retard ratiopharm®, sind nicht zur Akutbehandlung des Status asthmaticus oder der akuten Bronchospastik bestimmt.</i>
Phosphodiesterase-Inhibitoren	
Roflumilast, oral R03DX07 Daxas®	Daxas® ist indiziert zur Dauertherapie bei erwachsenen Patienten mit schwerer COPD (chronisch-obstruktive pulmonale Erkrankung, FEV ₁ nach Anwendung eines Bronchodilatators weniger als 50% vom Soll) und chronischer Bronchitis sowie häufigen Exazerbationen in der Vergangenheit, begleitend zu einer bronchodilatatorischen Therapie.
Glukokortikosteroide	
Glukokortikosteroide, inhalativ	
Beispielhaft	Zur Behandlung von Atemwegserkrankungen, wenn die Anwendung von Glukokortikoiden erforderlich ist, wie z. B. bei

II. Zugelassene Arzneimittel im Anwendungsgebiet COPD

Wirkstoff ATC-Code Handelsnam e	Anwendungsgebiet (Text aus Fach-/Gebrauchsinformation)
Beclometason R03BA01 generisch	<ul style="list-style-type: none"> – Asthma bronchiale – chronisch obstruktive Bronchitis <p><i>Hinweis: nicht zur Behandlung von plötzlich auftretenden Atemnotanfällen (akuter Asthmaanfall oder Status asthmaticus) geeignet.</i></p>
Glucokortikosteroide, oral	
Kombinationen: Selektiver Beta2-Adrenozeptor-Agonist + Anticholinergikum	
Salbutamol + Ipratropiumbr omid R03AK04 generisch	Zur Behandlung von Bronchospasmen bei Patienten, die an chronisch obstruktiver Lungenkrankheit (COPD) leiden und eine regelmäßige Behandlung mit Ipratropiumbromid und Salbutamol benötigen.
Fenoterol + Ipratropiumbr omid R03AK03 generisch	indiziert zur Vorbeugung und Behandlung von Bronchospasmen bei Asthma und chronischer obstruktiver Atemwegserkrankung (COPD). Eine begleitende entzündungshemmende Behandlung sollte stets in Betracht gezogen werden.
Indacaterol + Glycopyrroni mbromid R03AL04 Ultibro® Breezhaler®	Ultibro Breezhaler ist für die bronchialerweiternde Erhaltungstherapie zur Symptomlinderung bei erwachsenen Patienten mit chronisch-obstruktiver Lungenerkrankung (COPD) angezeigt.

II. Zugelassene Arzneimittel im Anwendungsgebiet COPD	
Wirkstoff ATC-Code Handelsnam e	Anwendungsgebiet (Text aus Fach-/Gebrauchsinformation)
Vilanterol + Umeclidinium bromid R03AL03 ANORO®	ANORO® ist für die bronchialerweiternde Erhaltungstherapie zur Symptomlinderung bei erwachsenen Patienten mit chronisch obstruktiver Lungenerkrankung (COPD) angezeigt.
Formoterol + Aclidiniumbro mid R03AL05 Brimica® Genuar®	Brimica® Genuar® ist indiziert als bronchodilatatorische Erhaltungstherapie zur Linderung von Symptomen bei Erwachsenen mit chronisch-obstruktiver Lungenerkrankung (COPD).
Tiotropium/OI odaterol R03AL06 Spiolto® Respimat®	Spiolto® Respimat® ist indiziert als Bronchodilatator zur Dauerbehandlung, um bei erwachsenen Patienten mit chronisch obstruktiver Lungenerkrankung (COPD) die Symptome zu lindern.
Beclometaso n / Formoterol / Glycopyrroni um R03AL09 Trimbow®	Zur Erhaltungstherapie bei erwachsenen Patienten mit moderater bis schwerer chronisch obstruktiver Lungenerkrankung (COPD), die mit einer Kombination aus einem inhalativen Kortikosteroid und einem langwirksamen Beta-2-Agonisten nicht ausreichend eingestellt sind (zu den Wirkungen hinsichtlich Symptomkontrolle und Prävention von Exazerbationen siehe Abschnitt 5.1). <i>Anwendungsbeschränkungen</i> <i>Das Arzneimittel ist nicht angezeigt zur Behandlung akuter Episoden von Bronchospasmen oder akuter Exazerbationen bei COPD (d. h. als Notfallmedikation).</i>
Kombinationen: Selektiver Beta2-Adrenozeptor-Agonist + Glucokortikosteroid	
Salmeterol +	wird bei der symptomatischen Behandlung von Patienten mit COPD angewendet, die eine FEV ₁ < 60% des vorhergesagten

II. Zugelassene Arzneimittel im Anwendungsgebiet COPD

Wirkstoff ATC-Code Handelsnam e	Anwendungsgebiet (Text aus Fach-/Gebrauchsinformation)
Fluticasone R03AK06 generisch	Normwerts (vor Anwendung eines Bronchodilatators) und wiederholt Exazerbationen aufweisen und trotz kontinuierlicher Therapie mit Bronchodilatatoren an signifikanten Symptomen leiden.
Formoterol + Budesonid R03AK07 Symbicort®	Symptomatische Behandlung von Patienten mit schwerer COPD ($FEV_1 < 50\%$ des Normwertes) und wiederholten Exazerbationen in der Vorgeschichte, die trotz einer regelmäßigen Behandlung mit lang wirksamen Bronchodilatatoren erhebliche Symptome aufweisen.
Vilanterol + Fluticasonfuro at R03AK10 Relvar® Ellipta®	Relvar® Ellipta® ist angezeigt für die symptomatische Behandlung von Erwachsenen mit COPD mit einem $FEV_1 < 70\%$ des Normwerts (nach Anwendung eines Bronchodilatators), die trotz regelmäßiger bronchodilatorischer Therapie Exazerbationen in der Vorgeschichte aufweisen.

Recherche und Synopse der Evidenz zur Bestimmung der zweckmäßigen Vergleichstherapie (zVT):

Inhalt

Systematische Recherche:	10
Indikation:	10
Berücksichtigte Wirkstoffe/Therapien:	11
IQWiG Berichte/G-BA Beschlüsse	13
Cochrane Reviews	28
Systematische Reviews	45
Leitlinien	68
Ergänzende Dokumente anderer Organisationen zu möglichen Komparatoren	81
Detaillierte Darstellung der Recherchestrategie	82
Literatur	84

Systematische Recherche:

Es wurde eine systematische Literaturrecherche nach systematischen Reviews, Meta-Analysen, HTA-Berichten und evidenzbasierten systematischen Leitlinien zur Indikation *chronisch obstruktiver Lungenerkrankung (COPD)* durchgeführt. Der Suchzeitraum wurde auf die letzten 5 Jahre eingeschränkt und die Recherche am 26.02.2018 abgeschlossen. Die Suche erfolgte in den aufgeführten Datenbanken bzw. Internetseiten folgender Organisationen: The Cochrane Library (Cochrane Database of Systematic Reviews, Health Technology Assessment Database), MEDLINE (PubMed), AWMF, Clinical Evidence, DAHTA, G-BA, GIN, IQWiG, NGC, NICE, TRIP, SIGN, WHO. Ergänzend erfolgte eine freie Internetsuche nach aktuellen deutschen und europäischen Leitlinien. Die detaillierte Darstellung der Suchstrategie ist am Ende der Synopse aufgeführt.

Die Recherche ergab 1456 Quellen, die anschließend in einem zweistufigen Screening-Verfahren nach Themenrelevanz und methodischer Qualität gesichtet wurden. Zudem wurde eine Sprachrestriktion auf deutsche und englische Quellen vorgenommen. Insgesamt ergab dies 39 Quellen, die in die synoptische Evidenz-Übersicht aufgenommen wurden.

Indikation:

Erwachsene Patienten mit moderater bis schwerer chronisch obstruktiver Lungenerkrankung (COPD).

Berücksichtigte Wirkstoffe/Therapien:

Übersicht zVT, Tabellen „I. Zweckmäßige Vergleichstherapie“ und „II. Zugelassene Arzneimittel im Anwendungsbereich.“

Abkürzungen:

AkdÄ	Arzneimittelkommission der deutschen Ärzteschaft
AE	adverse effect/event
AWMF	Arbeitsgemeinschaft der wissenschaftlichen medizinischen Fachgesellschaften
COPD	chronic obstructive pulmonary disease
DAHTA	Datenbank der Deutsche Agentur für Health Technology Assessment
FEV1	Forced expiratory volume in the first second
FSC	fluticasone propionate/salmeterol
FF/VI	Fluticasone furoate/vilanterol
G-BA	Gemeinsamer Bundesausschuss
GIN	Guidelines International Network
ICS	inhaled corticosteroids
ICTRP	International Clinical Trials Registry Platform
IQWiG	Institut für Qualität und Wirtschaftlichkeit im Gesundheitswesen
ISRCTN	International Standard Randomised Controlled Trial Number

AE	adverse event
FPS	fluticasone/salmeterol
FP	fluticasone propionate
BDF	budesonide/formoterol
MF/F	mometasone furoate and formoterol
MF	mometasone furoate

BID	twice daily
MDI	metered-dose inhaler

IQWiG Berichte/G-BA Beschlüsse

<p>Institut für Qualität und Wirtschaftlichkeit im Gesundheitswesen (IQWiG), 2013 [18].</p> <p>Systematische Leitlinienrecherche und -bewertung sowie Extraktion relevanter Empfehlungen für das DMP chronisch obstruktive Lungenerkrankung; Abschlussbericht; Auftrag V12-01</p>	<p>5.4.5.7 Versorgungsaspekt „Medikamentöse Maßnahmen“ (1.5.7 der DMP-Richtlinie)</p> <p><i>DMP-Richtlinie</i></p> <p>Zur medikamentösen Therapie sind mit der Patientin oder dem Patienten ein individueller Therapieplan zu erstellen und Maßnahmen zum Selbstmanagement zu erarbeiten (siehe auch strukturierte Schulungsprogramme [Ziffer III 4]).</p> <p>Vorrangig sollen unter Berücksichtigung der Kontraindikationen und der Präferenzen der Patientinnen und Patienten Medikamente verwendet werden, deren positiver Effekt und Sicherheit im Hinblick auf die unter Ziffer III 1.3 genannten Therapieziele in prospektiven, randomisierten, kontrollierten Studien nachgewiesen wurde. Dabei sollen vorrangig diejenigen Wirkstoffe / Wirkstoffgruppen oder Kombinationen bevorzugt werden, die diesbezüglich den größten Nutzen erbringen.</p> <p>Da das Ansprechen auf Medikamente individuell und im Zeitverlauf unterschiedlich sein kann, ist ggf. ein Auslassversuch unter Kontrolle der Symptomatik und der Lungenfunktion zu erwägen.</p> <p>Sofern im Rahmen der individuellen Therapieplanung andere Wirkstoffgruppen oder Wirkstoffe als die in dieser Anlage genannten verordnet werden sollen, ist die Patientin oder der Patient darüber zu informieren, ob für diese Wirkstoffgruppen oder Wirkstoffe Wirksamkeitsbelege bzgl. der unter Ziffer III 1.3 genannten Therapieziele vorliegen.</p> <p>Ziel der medikamentösen Therapie ist es insbesondere, die Symptomatik (vor allem Husten, Schleimretention und Luftnot) zu verbessern und Exazerbationen zeitnah zu behandeln sowie deren Rate zu reduzieren.</p> <p>In der medikamentösen Behandlung der COPD werden Bedarfstherapeutika (Medikamente, die z. B. bei Atemnot eingenommen werden) und Dauertherapeutika (Medikamente, die als Basistherapie regelmäßig eingenommen werden) unterschieden.</p> <p>Vorrangig sollten folgende Wirkstoffgruppen verwendet werden:</p> <p>2) Dauertherapie:</p> <ul style="list-style-type: none">• lang wirksames Anticholinergikum,• lang wirksames Beta-2-Sympathomimetikum.• In begründeten Einzelfällen:• Theophyllin (Darreichungsform mit verzögerter Wirkstofffreisetzung),• inhalative Glukokortikosteroide (bei schwerer und
---	---

	<p>sehr schwerer COPD, insbesondere dann, wenn häufige Exazerbationen auftreten oder Zeichen eines Asthma bronchiale bestehen).</p> <p>Bei gehäuft auftretenden Exazerbationen können mukoaktive Substanzen (Acetylcystein, Ambroxol, Carbocistein) erwogen werden.</p> <p>In der Inhalationstherapie ist nur die im Bronchialsystem deponierte Medikamentenmenge wirksam. Diese hängt stark ab von der individuellen Anatomie der Atemwege, dem Atemmuster, der Partikelgröße und dem Inhalationssystem. Es sollten daher das Inhalationssystem und die Schulung individuell an die Bedürfnisse und Fähigkeiten (insbesondere Alter und Koordination) angepasst werden. Darüber hinaus ist es sinnvoll, in der Dauertherapie bei Verwendung mehrerer inhalativer Medikamente für alle Präparate den gleichen Typ von Inhalationssystem einzusetzen. Nach einer initialen Einweisung in die Inhalationstechnik sollte diese in jedem Dokumentationszeitraum mindestens einmal überprüft werden.</p> <p><i>Aussagen der eingeschlossenen Leitlinien</i></p> <p>6 der eingeschlossenen Leitlinien (BTS 2007, NICE 2010, ACP 2011, CTS 2011, GOLD 2013 und RNAO 2010) enthalten Empfehlungen zur medikamentösen Therapie der COPD.</p> <p>Der Versorgungsaspekt „Medikamentöse Maßnahmen“ (1.5.7 der DMP-Richtlinie) wurde der Übersichtlichkeit halber in Unterpunkte untergliedert. Im Folgenden werden zunächst allgemeine Empfehlungen zur medikamentösen Therapie beschrieben. Anschließend werden Bronchodilatatoren und Kortikosteroide einzeln, gefolgt von weiteren medikamentösen Maßnahmen, dargestellt. Alle Angaben zur medikamentösen Behandlung von Exazerbationen werden gesondert im Versorgungsaspekt „Exazerbationen / Atemwegsinfekte“ (1.5.7.2 der DMP-Richtlinie) behandelt.</p> <p><i>Abgleich mit den Anforderungen der DMP-Richtlinie zu „Aussagen der eingeschlossenen Leitlinien zu Bronchodilatatoren“ (Anmerkung FB Med: Hier keine Aussagen extrahiert, wenn sich kein Aktualisierungs- bzw. Ergänzungsbedarf ergibt.)</i></p> <p>Eine Leitlinie gibt mit hoher LoE-Kategorie die Empfehlung, dass bevorzugt inhalative Zubereitungen in der medikamentösen Therapie eingesetzt werden sollen. Die Leitlinie beinhaltet im Vergleich zur DMP-Richtlinie eine zusätzliche Empfehlung. Ein potenzieller Aktualisierungs- bzw. Ergänzungsbedarf kann diskutiert werden.</p> <p>Eine Leitlinie gibt mit hoher LoE-Kategorie die Empfehlung, dass lang wirksame Anticholinergika und Beta-2-</p>
--	--

	<p>Sympathomimetika kurz wirksamen vorgezogen werden sollen. Die Leitlinie beinhaltet im Vergleich zur DMP-Richtlinie eine zusätzliche Empfehlung. Ein potenzieller Aktualisierungs- bzw. Ergänzungsbedarf kann diskutiert werden.</p> <p>2 Leitlinien geben mit uneinheitlicher GoR- / LoE-Kategorie und eine Leitlinie ohne Angaben zu GoR und nicht zuordenbarem LoE Empfehlungen zur Kombinationstherapie von lang wirksamen Beta-2-Sympathomimetika mit lang wirksamen Anticholinergika. Die Leitlinien beinhalten im Vergleich zur DMP-Richtlinie zusätzliche Empfehlungen. Ein potenzieller Aktualisierungs- bzw. Ergänzungsbedarf kann diskutiert werden.</p> <p>Eine Leitlinie gibt mit hoher GoR-Kategorie Empfehlungen zum Einsatz von Theophyllin in Kombination mit Beta-2-Sympathomimetika oder Anticholinergika, wenn die Monotherapie mit Bronchodilatatoren nicht zur Verbesserung der Symptomatik führt. Die Leitlinie beinhaltet im Vergleich zur DMP-Richtlinie zusätzliche Empfehlungen. Ein potenzieller Aktualisierungs- bzw. Ergänzungsbedarf kann diskutiert werden.</p> <p><i>Abgleich mit den Anforderungen der DMP-Richtlinie zu „Aussagen der eingeschlossenen Leitlinien zu Kortikosteroiden“ (Anmerkung FB Med: Hier keine Aussagen extrahiert, wenn sich kein Aktualisierungs- bzw. Ergänzungsbedarf ergibt.)</i></p> <p>Eine Leitlinie gibt mit hoher LoE-Kategorie eine negative Empfehlung für die alleinige Monotherapie mit inhalativen Kortikosteroiden. Die Leitlinie enthält im Vergleich zur DMP-Richtlinie eine zusätzliche Empfehlung. Ein potenzieller Aktualisierungs- bzw. Ergänzungsbedarf kann diskutiert werden.</p> <p>Eine Leitlinie gibt mit hoher LoE-Kategorie eine negative Empfehlung zum Einsatz von oralen Kortikosteroiden zur Langzeittherapie. Die Leitlinie beinhaltet im Vergleich zur DMP-Richtlinie eine zusätzliche Empfehlung. Ein potenzieller Aktualisierungs- bzw. Ergänzungsbedarf kann diskutiert werden.</p>
<p>Gemeinsamer Bundesausschuss (G-BA) [8].</p> <p>Beschluss über eine Änderung der Arzneimittel-Richtlinie (AM-RL): Anlage XII - Beschlüsse über die Nutzenbewertung von Arzneimitteln mit neuen</p>	<p>I. Die Anlage XII wird in alphabetischer Reihenfolge um den Wirkstoff Umeclidinium wie folgt ergänzt:</p> <p><u>Zugelassenes Anwendungsgebiet (laut Zulassung vom 28. April 2014):</u></p> <p>„Incruse® ist für die bronchialerweiternde Erhaltungstherapie zur Symptomlinderung bei erwachsenen Patienten mit chronisch-obstruktiver Lungenerkrankung (COPD) angezeigt.“</p> <p>1. Zusatznutzen des Arzneimittels im Verhältnis zur</p>

<p>Wirkstoffen nach § 35a SGB V – Umeclidinium</p> <p>vom 21. Juli 2016</p>	<p>zweckmäßigen Vergleichstherapie</p> <p>a) Erwachsene Patienten mit COPD ab einem mittleren Schweregrad ($50\% \leq \text{FEV}1^1 < 80\% \text{ Soll}$)²:</p> <p>Zweckmäßige Vergleichstherapie:</p> <p>Langwirksame Beta-2-Sympathomimetika oder langwirksame Anticholinergika (Tiotropium) oder die Kombination beider Wirkstoffklassen.</p> <p>Ausmaß und Wahrscheinlichkeit des Zusatznutzens gegenüber Tiotropium:</p> <p>Ein Zusatznutzen ist nicht belegt.</p> <p>b) Bei darüberhinausgehenden Schweregraden ($30\% \leq \text{FEV}1 < 50\% \text{ Soll}$ bzw. $\text{FEV}1 < 30\% \text{ Soll}$ oder <u>respiratorische Insuffizienz</u>) mit ≥ 2 Exazerbationen pro Jahr:</p> <p>Zweckmäßige Vergleichstherapie:</p> <p>Langwirksame Beta-2-Sympathomimetika oder langwirksame Anticholinergika (Tiotropium) oder die Kombination beider Wirkstoffklassen und zusätzlich inhalative Corticosteroide (ICS).</p> <p>Ausmaß und Wahrscheinlichkeit des Zusatznutzens gegenüber der zweckmäßigen Vergleichstherapie:</p> <p>Ein Zusatznutzen ist nicht belegt.</p> <p>1 FEV1: exspiratorische Einsekundenkapazität.</p> <p>2 Diese Population enthält Patienten mit COPD-Schweregrad II (keine Einschränkung hinsichtlich der Anzahl an Exazerbationen) und Patienten mit COPD-Schweregraden $\geq III$ mit < 2 Exazerbationen pro Jahr.</p>
<p>Gemeinsamer Bundesausschuss (G-BA), 2016 [6].</p> <p>Beschluss des Gemeinsamen Bundesausschusses über eine Änderung der Arzneimittel-Richtlinie (AM-RL): Anlage XII - Beschlüsse über die Nutzenbewertung von Arzneimitteln mit neuen Wirkstoffen nach § 35a SGB V – Aclidiniumbromid vom 7. April 2016</p>	<p>I. Die Anlage XII wird wie folgt geändert:</p> <ol style="list-style-type: none"> 1. Die Angaben zu Aclidiniumbromid in der Fassung der Beschlüsse vom 21. März 2013 und 20. <p>G-BA, 2017 [14].</p> <p>Richtlinie des Gemeinsamen Bundesausschusses zur</p>	<p>Anlage 11 Anforderungen an das strukturierte Behandlungsprogramm für Patientinnen und Patienten mit chronisch obstruktiver Lungenerkrankung (COPD)</p>

<p>Zusammenföhrung der Anforderungen an strukturierte Behandlungsprogramme nach § 137f Abs. 2 SGB V (DMP-Anforderungen-Richtlinie/DMP-A-RL) ... in Kraft getreten</p> <p>am 1. Januar 2017</p>	<p>1.5 Therapeutische Maßnahmen</p> <p>1.5.8 Medikamentöse Maßnahmen</p> <p>Zur medikamentösen Therapie sind mit der Patientin oder dem Patienten ein individueller Therapieplan zu erstellen und Maßnahmen zum Selbstmanagement zu erarbeiten (siehe auch strukturierte Schulungsprogramme [Nummer 4]).</p> <p>Vorrangig sollen unter Berücksichtigung der Kontraindikationen und der Präferenzen der Patientinnen und Patienten Medikamente verwendet werden, deren positiver Effekt und Sicherheit im Hinblick auf die in Nummer 1.3 genannten Therapieziele in prospektiven, randomisierten, kontrollierten Studien nachgewiesen wurde. Dabei sollen vorrangig diejenigen Wirkstoffe/Wirkstoffgruppen oder Kombinationen bevorzugt werden, die diesbezüglich den größten Nutzen erbringen.</p> <p>Da das Ansprechen auf Medikamente individuell und im Zeitverlauf unterschiedlich sein kann, ist gegebenenfalls ein Auslassversuch unter Kontrolle der Symptomatik und der Lungenfunktion zu erwägen.</p> <p>Sofern im Rahmen der individuellen Therapieplanung andere Wirkstoffgruppen oder Wirkstoffe als die in dieser Anlage genannten verordnet werden sollen, ist die Patientin oder der Patient darüber zu informieren, ob für diese Wirkstoffgruppen oder Wirkstoffe Wirksamkeitsbelege bezüglich der in Nummer 1.3 genannten Therapieziele vorliegen.</p> <p>Ziel der medikamentösen Therapie ist es insbesondere, die Symptomatik (vor allem Husten, Schleimretention und Luftnot) zu verbessern und Exazerbationen zeitnah zu behandeln sowie deren Rate zu reduzieren.</p> <p>In der medikamentösen Behandlung der COPD werden Bedarfstherapeutika (Medikamente, die z. B. bei Atemnot eingenommen werden) und <u>Dauertherapeutika</u> (<u>Medikamente, die als Basistherapie regelmäßig eingenommen werden</u>) unterschieden.</p> <p>Vorrangig sollten folgende Wirkstoffgruppen verwendet werden:</p> <p><u>2. Dauertherapie:</u></p> <ul style="list-style-type: none"> 2.1. lang wirksames Anticholinergikum, 2.2. lang wirksames Beta-2-Sympathomimetikum, 2.3. Kombination von lang wirksamem Anticholinergikum und lang wirksamem Beta-2-Sympathomimetikum. 2.4. In begründeten Einzelfällen: 2.4.1 inhalative Glukokortikosteroide (bei schwerer und
---	---

	<p>sehr schwerer COPD und zwar nur, wenn mindestens 2 Exazerbationen innerhalb von 12 Monaten auftreten oder Zeichen eines Asthma bronchiale bestehen),</p> <p>2.4.2 Roflumilast für Patienten mit schwerer und sehr schwerer COPD mit Symptomen wie Auswurf und Husten,</p> <p>2.4.3 Theophyllin (Darreichungsform mit verzögerter Wirkstofffreisetzung) nur, wenn die Wirkung von lang wirksamen Bronchodilatatoren und inhalativen Glukokortikosteroiden unzureichend ist.</p> <p>Bei gehäuft auftretenden Exazerbationen können mukoaktive Substanzen erwogen werden. Ein routinemäßiger Einsatz kann nicht empfohlen werden.</p> <p>In der Inhalationstherapie ist insbesondere die im Bronchialsystem deponierte Medikamentenmenge wirksam. Diese hängt stark ab von der individuellen Anatomie der Atemwege, dem Atemmuster, der Partikelgröße und dem Applikationssystem. Es sollte daher das Applikationssystem und die Schulung individuell an die Bedürfnisse und Fähigkeiten (insbesondere Alter und Koordination) angepasst werden. Darüber hinaus ist es sinnvoll, in der Dauertherapie bei Verwendung mehrerer inhalativer Medikamente für alle Präparate den gleichen Typ von Applikationssystem einzusetzen. Bei Patientinnen und Patienten, bei denen ein Wechsel des Applikationssystems absehbar Probleme bereiten wird, kann bei der Verordnung die Substitution durch Setzen des Aut-idem-Kreuzes ausgeschlossen werden. Nach einer initialen Einweisung in die Applikationstechnik soll diese in jedem Dokumentationszeitraum mindestens einmal überprüft werden.</p>
<p>Gemeinsamer Bundesausschuss (G-BA), 2014 [9].</p> <p>Beschluss des Gemeinsamen Bundesausschusses über eine Änderung der Arzneimittel-Richtlinie (AM- RL): Anlage XII - Beschlüsse über die Nutzenbewertung von Arzneimitteln mit neuen Wirkstoffen nach § 35a SGB Indacaterol/ Glycopyrronium</p> <p>vom 8. Mai 2014</p>	<p>Zugelassenes Anwendungsgebiet:</p> <p>Ultibro® Breezhaler®/Xoterna® Breezhaler® ist für die bronchialerweiternde Erhaltungstherapie zur Symptomlinderung bei erwachsenen Patienten mit chronisch-obstruktiver Lungenerkrankung (COPD) angezeigt.</p> <p>Patienten mit COPD Stufe II</p> <p>Ausmaß und Wahrscheinlichkeit des Zusatznutzens gegenüber einer Therapie mit langwirksamen Beta-2-Sympathomimetika (Formoterol oder Salmeterol) oder langwirksamen Anticholinergika (Tiotropium) oder der Kombination beider Wirkstoffklassen:</p> <p><u>Anhaltspunkt für einen geringen Zusatznutzen</u></p> <p>Patienten mit COPD Stufe III mit höchstens einer Exazerbation pro Jahr</p> <p>Ausmaß und Wahrscheinlichkeit des Zusatznutzens</p>

<p>Gemeinsamer Bundesausschuss (G-BA), 2014 [11].</p> <p>Beschluss über eine Änderung der Arzneimittel-Richtlinie (AM-RL): Anlage XII - Beschlüsse über die Nutzenbewertung von Arzneimitteln mit neuen Wirkstoffen nach § 35a SGB V - und Anlage IX - Festbetragsgruppenbildung Kombinationen von Glucocorticoiden mit langwirksamen Beta2-Sympathomimetika, Gruppe 1, in Stufe 3 nach § 35a Absatz 3 in Verbindung mit Absatz 4 Satz 1 SGB V</p> <p>vom 20. März 2014.</p> <p>Ergänzung der Wirkstoffkombination „Fluticasonfuroat/Vilanterol-Trifénatat“</p>	<p>Die Anlage XII wird in alphabetischer Reihenfolge um die Wirkstoffkombination „Fluticason furoat / Vilanterol“ wie folgt ergänzt:</p> <p>Ein medizinischer Zusatznutzen als therapeutische Verbesserung entsprechend § 35 Absatz 1b Satz 1 bis 5 SGB V der Kombination von Fluticason furoat und Vilanterol gegenüber den anderen Wirkstoffkombinationen der Festbetrags-gruppe „Kombinationen von Glucocorticoiden mit langwirksamen Beta2-Sympathomimetika, Gruppe 1“ in Stufe 3 gilt gemäß § 35a Absatz 1 Satz 4 und 5 SGB V als nicht belegt.“</p>

<p>Gemeinsamer Bundesausschuss (G-BA), 2014 [10].</p> <p>Beschluss über eine Änderung der Arzneimittel- Richtlinie (AM-RL): Anlage XII - Beschlüsse über die Nutzenbewertung von Arzneimitteln mit neuen Wirkstoffen nach § 35a SGB V - und Anlage IX - Festbetragsgruppenbildung Beta2-Sympathomimetika, inhalativ oral, Gruppe 1, in Stufe 2 nach § 35a Absatz 3 in Verbindung mit Absatz 4 Satz 1 SGB V</p> <p>vom 17.07.2014.</p> <p>Ergänzung des Wirkstoffs „Olodaterol“</p>	<p>Die Anlage XII wird in alphabetischer Reihenfolge um den Wirkstoff „Olodaterol“ wie folgt ergänzt: „Olodaterol [...]“ Ein medizinischer Zusatznutzen als therapeutische Verbesserung entsprechend § 35 Absatz 1b Satz 1 bis 5 SGB V von Olodaterol gegenüber den anderen Wirkstoffen der Festbetragsgruppe „Beta2-Sympathomimetika, inhalativ oral, Gruppe 1“ in Stufe 2 gilt gemäß § 35a Absatz 1 Satz 4 und 5 SGB V als nicht belegt.“</p>
<p>IQWiG, 2012 [19]. Tiotropiumbromid bei COPD; Abschlussbericht; Auftrag A05-18</p>	<p>Fragestellung/Ziele: Ziele der vorliegenden Untersuchung waren</p> <ul style="list-style-type: none"> • die Nutzenbewertung von Tiotropiumbromid im Vergleich zu einer Placebogabe oder anderen medikamentösen Therapieoptionen, einzeln oder in Kombination, und • die vergleichende Nutzenbewertung der beiden Tiotropiumbromid-Anwendungsformen HandiHaler und Respimat, jeweils für die inhalative Dauertherapie von patientenrelevanter Endpunkte. <p>Population: Für die Nutzenbewertung wurden Studien mit Patienten mit COPD berücksichtigt. Die Diagnose sollte anhand von Kriterien anerkannter Leitlinien gesichert und Asthmapatienten sollten ausgeschlossen sein.</p> <p>Endpunkte:</p> <ul style="list-style-type: none"> • COPD-Symptome • Exazerbationen • Notwendigkeit von Krankenhausaufenthalten und / oder von ambulanten ärztlichen Behandlungen wegen Exazerbationen • gesundheitsbezogene Lebensqualität

- körperliche Belastbarkeit
- COPD-assoziierte kardiovaskuläre Morbidität und Mortalität
- COPD-bedingte Letalität und Gesamt mortalität
- unerwünschte Arzneimittelwirkungen

Ergebnis /Fazit:

Nutzen von Tiotropium

Tiotropium vs. Placebo

Es gibt einen Beleg für einen Nutzen von Tiotropium für den Zeitraum von bis zu einem Jahr hinsichtlich der Häufigkeit von Exazerbationen. Für Patienten mit mittlerem und schwerem COPD-Schweregrad (GOLD II und III) ergibt sich dieser Beleg auch über diesen Zeitraum hinaus.

Es gibt einen Beleg für einen Nutzen von Tiotropium für den Zeitraum von bis zu einem Jahr hinsichtlich der Notwendigkeit von Krankenhausaufenthalten wegen Exazerbationen. Für Patienten mit mittlerem COPD-Schweregrad (GOLD II) ergibt sich dieser Beleg auch über diesen Zeitraum hinaus. Darüber hinaus ergibt sich ein Hinweis darauf, dass dieser Nutzen bei Frauen auch über diesen Zeitraum hinaus besteht.

Es gibt einen Beleg für einen Nutzen von Tiotropium hinsichtlich des Teilbereichs körperliche Gesundheit der gesundheitsbezogenen Lebensqualität und für den Zeitraum von bis zu einem Jahr einen Beleg für einen Nutzen von Tiotropium hinsichtlich der gesamten gesundheitsbezogenen Lebensqualität.

Es gibt einen Hinweis auf einen Nutzen von Tiotropium bei COPD-Symptomen.

Aus einer Langzeitstudie, in der Tiotropium mit dem HandiHaler angewendet wurde, ergibt sich hinsichtlich der Gesamt mortalität ein Hinweis auf einen Nutzen von Tiotropium bei Patienten, die das Rauchen eingestellt haben.

Hinsichtlich der Fähigkeit zur Ausübung alltagspraktischer Aktivitäten ergibt sich ein Anhaltspunkt für einen Nutzen von Tiotropium.

In den Bereichen körperliche Belastbarkeit, COPD-assoziierte kardiovaskuläre Morbidität und Mortalität, COPD-bedingte Letalität und unerwünschte Arzneimittelwirkungen gibt es keinen Beleg für einen Nutzen oder Schaden von Tiotropium.

	<p>Zur Bewertung des Nutzens von Tiotropium standen Studien mit einer Dauer von 6 bis 12 Monaten zur Verfügung und – mit Ausnahme der beiden Endpunkte COPD-Symptome sowie COPD-assoziierte kardiovaskuläre Morbidität und Mortalität – zusätzlich 2 Langzeitstudien mit einer Dauer von 2 und 4 Jahren.</p> <p><i>Tiotropium / LABA vs. LABA</i></p> <p>Es gibt keinen Beleg für einen Nutzen oder Schaden von Tiotropium, wenn es zusätzlich zu einer Behandlung mit LABA gegeben wird.</p> <p><i>Tiotropium / Salmeterol / Fluticason vs. Salmeterol / Fluticason</i></p> <p>Es gibt keinen Beleg für einen Nutzen oder Schaden von Tiotropium, wenn es zusätzlich zu einer Behandlung mit einer Kombination aus Salmeterol und Fluticason gegeben wird.</p> <p>Zusatznutzen von Tiotropium</p> <p><i>Tiotropium vs. LABA</i></p> <p>Es gibt einen Beleg für einen Zusatznutzen von Tiotropium gegenüber der Wirkstoffklasse LABA hinsichtlich der Häufigkeit von Exazerbationen und der Notwendigkeit von Krankena</p>

Cochrane Reviews

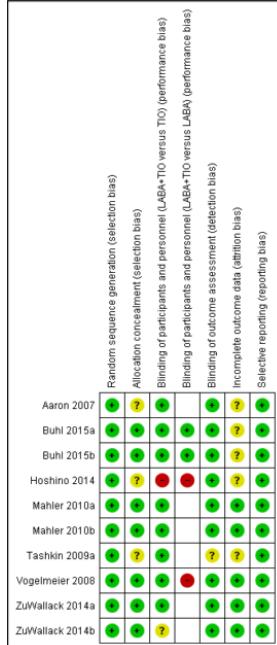

<p>Horita N et al. 2017 [16].</p> <p>Long-acting muscarinic antagonist (LAMA) plus long-acting beta-agonist (LABA) versus LABA plus inhaled corticosteroid (ICS) for stable chronic obstructive pulmonary disease (COPD)</p> <p><i>Siehe auch: Horita N et al. 2017 [17].</i></p> <p>Long-acting muscarinic antagonist + long-acting beta agonist versus long-acting beta agonist + inhaled corticosteroid for COPD: A systematic review and meta-analysis</p>	<p>1. Fragestellung To compare the benefits and harms of LAMA+LABA versus LABA+ICS for treatment of people with stable COPD.</p> <p>2. Methodik Population: adults with a diagnosis of COPD according to GOLD guidelines Intervention: LAMA+LABA Komparator: LABA+ICS Endpunkte: primary: Exacerbations (participants with one or more), serious adverse events (SAE) (Participants with one or more), St. George's Respiratory Questionnaire (SGRQ) total score change from baseline (mean difference (MD)), trough forced expiratory volume in one second (FEV1) change from baseline; secondary: Pneumonia* (participants with one or more occurrences), All-cause death, SGRQ total score change from baseline (4 points or greater), Hospitalisations for COPD exacerbations (participants with one or more occurrences), Pneumonia was assessed based on X-ray Suchzeitraum (Aktualität der Recherche): to 06/2016 Anzahl eingeschlossene Studien/Patienten (Gesamt): 11 (n=9839) Qualitätsbewertung der Studien: risk of bias for each study using the criteria outlined in the Cochrane Handbook for Systematic Reviews of Interventions</p> <p>3. Ergebnisdarstellung Qualität der Studien: These data were supported by low or moderate quality evidence from trials in people with mainly moderate to severe COPD who were studied for less than one year. <i>Exacerbations (9 studies/8932 participants)</i> - a significant decrease in the number of people experiencing one or more exacerbations with LAMA+LABA (OR 0.82, 95% CI 0.70 to 0.96; P = 0.01; I² = 17%; low quality evidence) <i>Serious adverse event (11 studies/9793 participants)</i> - However, we discarded data from one study from the analysis because there were no SAEs in either arm (Hoshino 2015) - Based on the remaining 10 studies, compared to LABA+ICS, LAMA+LABA was associated with a non-significant decrease in SAE (OR 0.91, 95% CI 0.79 to 1.05; P = 0.18; I² = 0; moderate quality of evidence). <i>Pneumonia (8 studies/8540 participants)</i> - Compared to LABA+ICS, there was a significant reduction in the number of participants experiencing one or more episodes of pneumonia with LAMA+LABA (OR 0.57, 95% CI 0.42 to 0.79; P = 0.0006; I² = 0%; low quality evidence). <i>All-cause death (8 studies/8200 participants)</i></p>
---	---

	<p>There was a similar risk of all-cause death with both treatment regimens (OR 1.01, 95%CI 0.61 to 1.67; P = 0.88; $I^2 = 0\%$; low quality evidence).</p> <p><i>St. George's Respiratory Questionnaire total score change from the baseline (2 studies/3192 participants)</i></p> <ul style="list-style-type: none"> - Compared to LABA+ICS, there was a more frequent change in SGRQ total score (4 points or greater) with LAMA+LABA (OR 1.25, 95% CI 1.09 to 1.44; P = 0.002; $I^2 = 0\%$; Analysis 1.7; moderate quality evidence). <p><i>Hospitalisations for COPD exacerbations</i></p> <ul style="list-style-type: none"> - Outcome not reported
	<p>4. Anmerkungen/Fazit der Autoren</p> <p>For the treatment of COPD, LAMA+LABA has fewer exacerbations, a larger improvement of FEV1, a lower risk of pneumonia, and more frequent improvement in quality of life as measured by an increase over 4 units or more of the SGRQ. These data were supported by low or moderate quality evidence generated from mainly participants with moderate to severe COPD in heterogeneous trials with an observation period of less than one year. Our findings support the recently updated GOLD guidance.</p> <p>5. 	<p>compared with tiotropium alone (mean difference (MD) -3.46, 95% CI -5.05 to -1.87; four studies; 1446 participants); low quality of evidence (downgraded because of study limitations: unclear risk of selection bias and detection bias and incomplete outcome assessment in 1 study; unclear risk of detection bias in 1 study; incomplete outcome assessment in 1 study)</p> <ul style="list-style-type: none"> • exercise tolerance not as an outcome assessed • pooled estimates did not show statistically significant differences in adverse events, serious adverse events, pneumonia <p>Tiotropium plus LABA/ICS versus LABA/ICS</p> <ul style="list-style-type: none"> • 1 of six studies (60 participants) also compared combined therapy (tiotropium + LABA/ICS) versus LABA/ICS therapy alone • study was affected by lack of power; therefore results did not allow to draw conclusions for this comparison
	<p>4. Fazit der Autoren</p> <p>In this update we found new moderate-quality evidence that combined tiotropium + LABA/ICS therapy compared with tiotropium plus placebo decreases hospital admission. Low-quality evidence suggests an improvement in disease-specific quality of life with combined therapy. However, evidence is insufficient to support the benefit of tiotropium + LABA/ICS for mortality and exacerbations (moderate and low-quality evidence, respectively). <u>Of note, not all participants enrolled in the included studies would be candidates for triple therapy according to current international guidance.</u></p> <p>Compared with the use of tiotropium plus placebo, tiotropium + LABA/ICS-based therapy does not increase undesirable effects such as adverse events or serious non-fatal adverse events.</p> <p>5. Kommentare zum Review:</p> <ul style="list-style-type: none"> • Spirometrieergebnisse nicht patientenrelevant (hier nicht berichtet)

- all trials compared tiotropium in addition to LABA to tiotropium alone
- four trials additionally compared LAMA plus LABA with LABA alone
- four studies used LABA olodaterol, three used indacaterol, two used formoterol, one used salmeterol

Health-related quality of life (St George's Respiratory Questionnaire (SGRQ))

- tiotropium alone vs. tiotropium plus LABA (6 709 participants; 5 studies):
 - slightly larger improvement: mean difference (MD) -1.34, 95% confidence interval (CI) -1.87 to -0.80
 - MD smaller than the four units that is considered clinically important
 - responder analysis indicated that 7% more participants receiving tiotropium plus LABA had a noticeable benefit (greater than four units) from treatment in comparison to tiotropium alone
 - In the control arm in one study, which was tiotropium alone, the SGRQ improved by falling 4.5 units from baseline and with tiotropium plus LABA the improvement was a fall of a further 1.3 units (on average).
- LABA plus tiotropium vs. LABA alone (3 378 participants; 4 studies):
 - small but significant improvement in SGRQ (MD -1.25, 95% CI -2.14 to -0.37)
 - although difference smaller than four units, still an

	<p>increase of 10 people with a clinically important improvement for 100 treated represented</p> <p>hospital admission or mortality</p> <ul style="list-style-type: none"> • no significant differences <p>exacerbations, symptom scores, serious adverse events, and withdrawals</p> <ul style="list-style-type: none"> • tiotropium alone vs. tiotropium plus LABA: no significant differences with moderate heterogeneity for both exacerbations and withdrawals • LABA plus tiotropium vs. LABA alone (3 514 participants; 3 studies): improvement in exacerbation rates: odds ratio (OR) 0.80, 95% CI 0.69 to 0.93.
	<p>4. Fazit der Autoren:</p> <p>The results from this review indicated a small mean improvement in health-related quality of life and FEV1 for participants on a combination of tiotropium and LABA compared to either agent alone, and this translated into a small increase in the number of responders on combination treatment. In addition, adding tiotropium to LABA reduced exacerbations, although adding LABA to tiotropium did not. Hospital admission and mortality were not altered by adding LABA to tiotropium, although there may not be enough data. While it is possible that this is affected by higher attrition in the tiotropium group, one would expect that participants withdrawn from the study would have had less favourable outcomes; this means that the expected direction of attrition bias would be to reduce the estimated benefit of the combination treatment. The results were largely from studies of olodaterol and there was insufficient information to assess whether the other LABAs were equivalent to olodaterol or each other.</p> <p>5. Kommentare zum Review:</p> <ul style="list-style-type: none"> • Spirometrieergebnisse nicht patientenrelevant (hier nicht berichtet) • vier verschiedene LABAs angewendet (salmeterol, formoterol, indacaterol, olodaterol) • hohe Fallzahlverluste schränken Vertrauen in die Effektschätzer zu health-related quality of life, hospital admission, mortality ein (moderate quality of evidence - GRADE)

quality. Tiotropium is available in two different inhalers, Respimat and Handihaler. A recent large double-blind trial of the two delivery devices found no substantial difference in mortality using 2.5 µg or 5 µg of tiotropium via Respimat in comparison to 18 µg via Handihaler.

	Random sequence generation (selection bias)	Allocation concealment (selection bias)	Blinding of participants and personnel (performance bias)	Blinding of outcome assessment (detection bias)	Incomplete outcome data (attrition bias)	Selective reporting (reporting bias)
Vincken 2002	+	?	+	?	+	+
Voshaar 2008	+	+	+	+	+	+

all-cause non-fatal serious adverse events (2 trials, n=1073)

There were fewer people experiencing one or more non-fatal serious adverse events on tiotropium compared to ipratropium (odds ratio (OR) 0.50; 95% CI 0.34 to 0.73)

mortality, all-cause (2 trials, n=1073)

There was no statistically significant difference in the number of deaths between tiotropium and ipratropium (OR 1.39; 95% CI 0.44 to 4.39, moderate quality evidence)

Hospital admissions

- both studies reported fewer hospital admissions in the tiotropium group (OR 0.34; 95% CI 0.15 to 0.70, moderate quality evidence)
- both studies reported fewer patients experiencing one or more exacerbations leading to hospitalisation in the people on tiotropium in both studies (OR 0.56; 95% CI 0.31 to 0.99, moderate quality evidence)

Lebensqualität

- 1 study measured quality of life using the St George's Respiratory Questionnaire (SGRQ)
- mean SGRQ score at 52 weeks was lower in the tiotropium group than the ipratropium group (lower on the scale is favourable) (MD -3.30; 95% CI -5.63 to -0.97, moderate quality evidence)

exacerbations

- fewer participants suffering one or more exacerbations in the tiotropium arm (OR 0.71; 95% CI 0.52 to 0.95, high quality

	<p>evidence)</p> <ul style="list-style-type: none"> • reported difference in mean number of exacerbations per person per year which reached statistical significance (MD -0.23; 95% CI -0.39 to -0.07, P = 0.006, moderate quality evidence) <p>withdrawals (2 trials, n=1073)</p> <ul style="list-style-type: none"> • significantly fewer withdrawals from the tiotropium group (OR 0.58; 95% CI 0.41 to 0.83, high quality evidence)
	<p>4. Fazit der Autoren</p> <p>This review shows that tiotropium treatment, when compared with ipratropium bromide, was associated with improved lung function, fewer hospital admissions (including those for exacerbations of COPD), fewer exacerbations of COPD and improved quality of life. There were both fewer serious adverse events and disease specific events in the tiotropium group, but no significant difference in deaths with ipratropium bromide when compared to tiotropium. Thus, tiotropium appears to be a reasonable choice (instead of ipratropium bromide) for patients with stable COPD, as proposed in guidelines. A recent large double-blind trial of the two delivery devices found no substantial difference in mortality using 2.5 µg or 5 µg of tiotropium via Respimat in comparison to 18 µg via Handihaler.</p> <p>5. 3. Ergebnisdarstellung

Qualität der Studien:

Quality of the evidence

- comparison of aclidinium inhalers and dummy inhalers: confidence that there are benefits in terms of the number of hospitalisations and patients' quality of life
- less certain: numbers of flare-ups needing additional drugs and serious side effects
- not have enough information to assess any effect on the number of deaths
- not have enough information to reliably compare aclidinium with tiotropium or formoterol

Mortality/exacerbations

- no difference between aclidinium and placebo in
 - all-cause mortality (low quality)
 - number of patients with exacerbations requiring a short

	<p>course of oral steroids or antibiotics, or both (moderate quality)</p> <p>Quality of life</p> <ul style="list-style-type: none"> • Aclidinium lowered SGRQ total score with a mean difference of -2.34 (95% CI -3.18 to -1.51; I² = 48%, 7 trials, 4442 participants) compared to placebo • More patients on aclidinium achieved a clinically meaningful improvement of at least four units decrease in SGRQ total score (OR 1.49; 95% CI 1.31 to 1.70; I² = 34%; number needed to treat (NNT) = 10, 95% CI 8 to 15, high quality evidence) over 12 to 52 weeks than on placebo <p>Hospitalisations</p> <ul style="list-style-type: none"> • Aclidinium reduced number of exacerbations requiring hospitalisation by 4 to 20 fewer per 1000 over 4 to 52 weeks (OR 0.64; 95% CI 0.46 to 0.88; I² = 0%, 10 trials, 5624 people; NNT = 77, 95% CI 51 to 233, high quality evidence) compared to placebo • no difference in non-fatal serious adverse events (moderate quality evidence) <p>Compared to tiotropium, aclidinium did not demonstrate significant differences for exacerbations requiring oral steroids or antibiotics, or both, exacerbation-related hospitalisations and non-fatal serious adverse events (very low quality evidence). Inadequate data prevented the comparison of aclidinium to formoterol or other LABAs.</p>
	<p>4. Fazit der Autoren:</p> <p>Aclidinium is associated with improved quality of life and reduced hospitalisations due to severe exacerbations in patients with moderate to severe stable COPD compared to placebo. Overall, aclidinium did not significantly reduce mortality, serious adverse events or exacerbations requiring oral steroids or antibiotics, or both. Currently, the available data are insufficient and of very low quality in comparisons of the efficacy of aclidinium versus tiotropium. The efficacy of aclidinium versus LABAs cannot be assessed due to inaccurate data. Thus additional trials are recommended to assess the efficacy and safety of aclidinium compared to other LAMAs or LABAs.</p> <p>5. Systematische Reviews

<p>Rodrigo GJ et al., 2017 [30].</p> <p>A systematic review with meta-analysis of fluticasone furoate/vilanterol combination for the treatment of stable COPD</p>	<p>1. Fragestellung</p> <p>The aim of this systematic review was to assess all available evidence on the efficacy and safety of the combination FF/VI compared with its mono-components, for the treatment of patients with stable COPD.</p>
	<p>2. Methodik</p> <p>Population: patients with stable COPD Intervention: fluticasone furoate/vilanterol combination Komparator: mono-component Endpunkte: 1) efficacy in terms of change in pulmonary function (trough or peak FEV1), and annual rate or number of subjects with at least one COPD moderate (requiring treatment with oral corticosteroid/antibiotic) or severe exacerbations (leading to hospitalization), and 2) serious adverse events (SAEs), serious cardiac events (SCEs) and pneumonia.</p> <p>Recherche: to July 2016 Anzahl eingeschlossene Studien/Patienten (Gesamt): Five reports with six trials (n=15,515 patients)</p> <p>Qualitätsbewertung der Studien: gemäß Cochrane</p>
	<p>3. Ergebnisdarstellung</p> <p>Qualität der Studien: overall the studies showed a high methodological quality</p> <p><i>FF/VI vs. VI comparison</i></p> <p>Primary end points:</p> <ul style="list-style-type: none"> - The use of FF/VI was associated with a significant increase (mean change from baseline) in trough FEV1 compared with VI monotherapy (Fig. 3) - At the end of treatment the mean difference was 45 mL (95% CI; 27 to 62). - On the contrary, there was no difference in peak FEV1 between both groups (based in data from only two small studies) - FF/VI significantly reduced the number of subjects with at least one moderate-severe exacerbation (23.4% vs. 28.3%, NNT = 21, 95%CI: 15 to 31) - It is noteworthy that only one study (including two RCTs) collected COPD moderate-severe exacerbations as a primary end point; in the remaining studies these events were reported as AEs. - Likewise, therewere no statistical differences in the rates of SAEs (20.3% vs. 20.6%) and SCEs (13.7% vs. 13.1%) between FF/VI and VI

	<p>Secondary end points:</p> <ul style="list-style-type: none"> - no significant differences in the rate of total withdrawals (23.6% vs. 25.7%), withdrawals due to AEs (7.8% vs. 8.3%), AEs (67% vs. 66.2%), and all-cause mortality (4.6% vs. 5.0%) between FF/VI and VI - Contrarily, FF/VI significantly reduced the rate of withdrawals due to lack of efficacy (1.8% vs. 2.9%), and the number of instances that rescue medication was used <p><i>FF/VI vs. FF comparison</i></p> <p>Primary end points</p> <ul style="list-style-type: none"> - The analysis of three studies [19e21] that compared FF/VI 100/25 mcg OD vs. FF 100 mcg OD showed that patients receiving FF/VI significantly increased pulmonary function compared with mono-therapy (mean change from baseline in trough and peak FEV1 of 90 mL and 130 mL respectively) and reduced the rate of COPD exacerbations (20.4% vs. 24.4%, NNT = 26, 95%CI: 18 to 44). - no significance differences in the frequency of SAEs (21.6% vs. 20.8%), SCEs (16.1% vs. 15.3%), and pneumonia (5.2% vs. 5.0%) <p>Secondary end points</p> <ul style="list-style-type: none"> - no significant differences between FF/VI vs. FF in the rate total withdrawals (23.5% vs. 20.0%), withdrawals due to AEs (7.9% vs. 8.6%), AEs (65.5% vs. 66.1%), all-cause mortality (5.4% vs. 5.5%), and pneumonia (5.2% vs. 5.0%) between FF/VI and VI - Contrarily, FF/VI significantly reduced the rate of withdrawals due to lack of efficacy (1.4% vs. 2.6%), and the use of rescue medication
	<p>4. Anmerkungen/Fazit der Autoren</p> <p>FF/VI combination was associated with a decrease of the rate of COPD exacerbations, without affecting mortality or cardiovascular outcomes in patients with moderate to severe stable COPD. Also, the use of FF was associated with an increased risk of pneumonia.</p>
<p>Rodrigo GJ et al., 2017 [32].</p> <p>LABA/LAMA combinations versus LAMA monotherapy or</p>	<p>1. Fragestellung</p> <p>The objective of this analysis was to compare the efficacy and safety of LABA/LAMA with LAMA or LABA/inhaled corticosteroid (ICS) in adults with stable moderate-to-very-severe COPD.</p> <p>2. Methodik</p>

LABA/ICS in COPD: a systematic review and meta-analysis	<p>Population: n adult patients aged ≥ 40 years with stable, moderate-to-verysevere COPD Intervention: LABA/LAMA combinations Komparator: LAMA monotherapy or LABA/ICS Endpunkte: primary outcome was trough FEV1 outcomes included peak FEV1; secondary outcomes: peak FEV, TDI, SGRQ, rescue medication use, prospectively collected annualized rate of COPD exacerbations, AEs and related safety measure Recherche: to 08/2015 Anzahl eingeschlossene Studien/Patienten (Gesamt): 18 studies (23 trials)/n=20185</p> <p>Qualitätsbewertung der Studien: Cochrane risk of bias tool</p>
	<p>3. Ergebnisdarstellung</p> <p>Qualität der Studien: Across the six items of the Cochrane instrument, the majority of the studies were judged to have a low risk of bias.</p> <p>Effect of treatments on lung function (trough and peak FEV1):</p> <ul style="list-style-type: none"> - At week 12, significant increases from baseline were observed in trough FEV1 for the LABA/LAMAs indacaterol (Ind)/glycopyrronium (Gly) (both dose regimens), umeclidinium (Umecl)/vitanterol (Vi) and tiotropium (Tio)/olodaterol (Olo) relative to the respective LAMAs evaluated in their studies (mean differences: 0.06–0.10 L; $P < 0.0001$; Figure 2). - The between-treatment difference for aclidinium (Acli)/formoterol (For) versus Acli was not statistically significantly different ($P = 0.06$), but a trend in favor of Acli/For was evident. - Overall, for all LABA/LAMA versus LAMA comparisons, a significant improvement in trough FEV1 with LABA/ LAMA treatment was observed at week 12 (mean overall difference: 0.07 L, 95% confidence interval [CI]: [0.05, 0.09]; $P < 0.0001$ relative to LAMA monotherapy). <p>Effect of treatments on dyspnea, health status and rescue medication use:</p> <ul style="list-style-type: none"> - TDI focal score was significantly improved in LABA/ LAMA-versus LAMA-treated patients at weeks 12 and 24 (mean difference: 0.5 points, 95% CI: [0.32, 0.68], $P < 0.0001$, and mean difference: 0.29 points, 95% CI: [0.12, 0.46], $P = 0.0006$, respectively) - No statistically significant difference between LABA/LAMA and LABA/ICS treatments with respect to TDI focal scores at weeks 12 and 26 were observed ($P = 0.09$ and $P = 0.29$, respectively) - Adverse event (AE) incidence was no different for LABA/LAMA versus LAMA treatment, but it was lower versus LABA/ICS (RR 0.94, 95% CI: [0.89, 0.99]), including a lower pneumonia risk

	<p>(RR 0.59, 95% CI: [0.43, 0.81]).</p> <ul style="list-style-type: none"> - LABA/LAMA presented a lower risk for withdrawals due to lack of efficacy versus LAMA (RR: 0.66, 95% CI: [0.51, 0.87]) and due to AEs versus LABA/ICS (RR: 0.83, 95% CI: [0.69, 0.99]).
	<p>4. Anmerkungen/Fazit der Autoren</p> <p>The greater efficacy and comparable safety profiles observed with LABA/LAMA combinations versus LAMA or LABA/ICS support their potential role as first-line treatment options in COPD. These findings are of direct relevance to clinical practice because we included all currently available LABA/LAMAs and comparators, only at doses approved for clinical use.</p> <p>5. Kommentare zum Review</p> <ul style="list-style-type: none"> - Eingeschlossene Studien zum Teil industriege sponsort
Jafari Andarian S et al., 2016 [21]. The safety and effectiveness of the current treatment regimen with or without roflumilast in advanced COPD patients: A systematic review and meta-analysis of randomized controlled trials	<p>1. Fragestellung</p> <p>The aim of this study was to compare the clinical effectiveness of adding roflumilast to the current treatment regimen of patients with severe COPD.</p> <p>2. Methodik</p> <p>Population: Moderate to severe COPD patients ($FEV1 \leq 50\%$ predicted) over 18 years Intervention: Roflumilast Komparator: A Common Treatment Regimen Laba (Salmeterol), Lama (Tiotropium) Endpunkte: number of exacerbations, changes in lung function FEV1, FEV1 / FVC, quality of life, adverse events, the frequency of hospitalization, cardiovascular diseases</p> <p>Recherche: to 02/2014 Anzahl eingeschlossene Studien/Patienten (Gesamt): 7 RCTs; 2 SR</p> <p>Qualitätsbewertung der Studien: gemäß Cochrane</p> <p>3. Ergebnisdarstellung</p> <p>Qualität der Studien: Overall, the methodological quality of all the published trials was acceptable. There were adequate descriptions of allocation concealment and method of blinding in all the trials.</p> <p>Change in the Lung Function from Baseline:</p> <ul style="list-style-type: none"> - a statistically significant improvement in FEV1 from baseline in the roflumilast treated participants compared to controls (MD 51.18 mL; 95%CI 41.45 to 60.90) over the study period <p>Exacerbations:</p>

	<ul style="list-style-type: none"> - A statistically significant reduction in the numbers of participants experiencing one or more COPD exacerbations <p>Quality of Life:</p> <ul style="list-style-type: none"> - In the subgroup analysis of M2-112 and M2-111 studies, significant improvement in SGRQ total score was observed for patients with chronic bronchitis ($p= 0.0265$) <p>Use of Rescue Medication:</p> <ul style="list-style-type: none"> - the meta-analysis of five studies was examined. The meta-analysis results revealed that the concurrent treatment of roflumilast with corticosteroids or long-acting β-agonists did not seem to have such beneficial effects on more people who experienced exacerbation during the study period <p>Adverse Events:</p> <ul style="list-style-type: none"> - The likelihood of a participant experiencing an adverse event was higher with roflumilast than with placebo (OR 1.21; 95% CI 1.09 to 1.34; Analysis 10). - A range of adverse effects occurred more frequently in participants treated with roflumilast. - The most frequently reported side effects were as follows: Diarrhea (OR 3.71; 95% CI 2.97 to 4.63; Analysis 11); nausea (OR 3.37; 95%CI 2.48 to 4.58); headache (OR 2.42; 95%CI 1.82 to 3.21); and weight loss (OR 3.85; 95% CI 3.03 to 4.90)
	<p>4. Anmerkungen/Fazit der Autoren</p> <p>Roflumilast anti-inflammatory therapy reduces the chronic bronchitis symptoms in patients with moderate to severe COPD, and it can be safely used with other drugs simultaneously.</p>

Ergebnisdarstellung</p> <p>Qualität der Studien:</p>

- 14 published papers and 1 abstract presented at ERS Congress (Amsterdam, 2015)
- 2 studies used aclidinium and formoterol
- 3 studies used tiotropium and olodaterol
- 4 studies used glycopyrronium and indacaterol
- 5 studies used umeclidinium and vilanterol
- 1 study used glycopyrronium and formoterol

Influence of LAMA/LABA combinations on TDI and SGRQ score vs. mono components

A

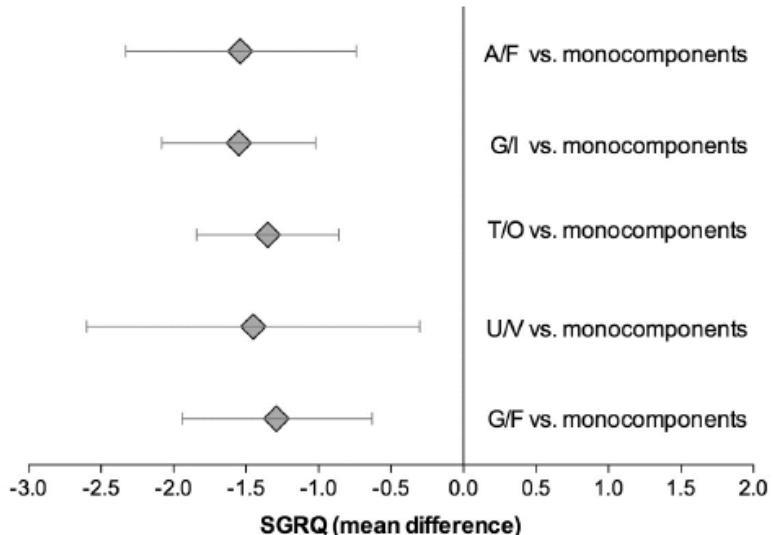

- significant funnel plot asymmetry detected for the impact of aclidinium/formoterol and tiotropium/olodaterol combinations on TDI
- smaller studies showed less beneficial effect for aclidinium/formoterol combination (Egger's test $P<0.1$)
- smaller studies reported larger protective effect for tiotropium/olodaterol combination (Egger's test $P<0.05$)

B

Diamond at Odds Ratio ~1.2

U/V 62.5/25µg vs. monocomponents

Diamond at Odds Ratio ~1.2

2. Anmerkungen/Fazit der Autoren

The gradient of effectiveness emerging from this meta-analysis is merely a weak indicator of possible differences between the various LAMA/LABA FDCs. Only direct comparisons will document if a specific LAMA/LABA FDC is better than the other. In the meanwhile, we think it is only proper consider the dual bronchodilation better than a LAMA or a LABA alone, regardless of drugs used.

Ergebnisdarstellung Qualität der Studien:</p>

All studies had clearly defined eligibility criteria, therapies, and reasons for patient exclusion except two unpublished RCTs. Allocation sequence generation and concealment were adequately described in 7 studies.

- 2 studies were unpublished [27,28],
- 2 studies respectively reported 2 RCTs [12,13]
- characteristics of the studies are in Table 1 (siehe Anhang)
- Grade of major patients was mild to severe for 7 RCTs [13,15e17,27,28], severe to very severe for 4 RCTs [12,14,18]
- duration of treatment: from 12 weeks to 52 weeks
- 9 RCTs [12,14e18,27,28] considered to be using a monotherapy, 2 RCTs [13] applied specific combination therapy
- definitions of COPD exacerbations varied among 8 RCTs

Primäre Endpunkte:

- roflumilast significantly reduces mean exacerbation rate ($WMD = -0.23$; $95\% CI = -0.33$ to -0.13 ; $p < 0.00001$; $I^2 = 18\%$)
- changes of mean exacerbation rate (23%) greater than the MCID of exacerbation rate ($\geq 22\%$)

Sekundäre Endpunkte:

- roflumilast failed to improve SGRQ total score
- changes of SGRQ total score lower than the MCID (≥ 4 units)

Sicherheit:

- overall mortality rate did not differ between roflumilast and placebo
- roflumilast associated with increases in
 - withdrawals due to AEs ($RR: 1.62$; $95\% CI : 1.44$ to 1.82 ; $p < 0.00001$)
 - number of patients experiencing any AEs ($RR = 1.08$; $95\% CI = 1.02$ to 1.14 ; $p < 0.007$)
 - diarrhoea ($RR = 3.75$; $95\% CI = 2.70$ to 5.21 ; $p < 0.00001$)
 - headache ($RR=2.32$; $95\% CI = 1.79$ to 3.02 ; $p < 0.00001$)

	<ul style="list-style-type: none"> ○ nausea (RR = 3.16; 95% CI = 2.01 to 4.96; p < 0.00001) ○ insomnia (RR = 2.41; 95% CI = 1.24 to 4.66; p < 0.009) ○ weight loss (RR = 4.37; 95% CI = 2.88 to 6.61; p < 0.00001) <ul style="list-style-type: none"> • roflumilast not associated with changes in nasopharyngitis, upper respiratory tract infection, influenza, and vomiting
	<p>4. Fazit der Autoren</p> <p>Roflumilast significantly reduces the mean exacerbation rate in COPD patients. Although there are insufficient clinical evidence on other clinical endpoints and high risk of some adverse events, roflumilast therapy may benefit COPD patients. Further studies are needed to pay more attention to the long-term efficacy and safety of roflumilast.</p> <p>5. TABLE 3] Rating the Confidence in the Estimate of the Effect

Quality of the Evidence	Level of Confidence in the Estimate of the Effect
High	Very confident that the true effect lies close to that of the estimate of the effect
Moderate	Moderately confident in the effect estimate: the true effect is likely to be close to the estimate of the effect, but there is a possibility that it is substantially different
Low	Confidence in the effect estimate is limited: the true effect may be substantially different from the estimate of the effect
Very low	Very little confidence in the effect estimate: the true effect is likely to be substantially different from the estimate of the effect

Sonstige methodische Hinweise

The PICO 2 inhaled therapies group reviewed 49 systematic reviews and determined that 30 were relevant. Of the 30 systematic reviews, 11 were used to directly inform the evidence base.

Two panelists in the PICO 2 inhaled therapies group were permitted to write recommendations, and they worked with the other panelists in the group to draft supporting text.

Recommendations were not made in instances where the panelists believed the data insufficient or inconclusive to warrant a recommendation. In instances where there was insufficient evidence but a recommendation was still warranted, a weak suggestion was developed, and consensus based (CB) replaced the grade.

It addresses the following elements.</i></p>
	<p>Freitext/Empfehlungen/Hinweise</p> <p><u>Recommendation 12.</u> We suggest offering the inhaled long-acting antimuscarinic agent (LAMA) tiotropium as first-line maintenance therapy in patients with confirmed, stable COPD who continue to have respiratory symptoms (e.g., dyspnea, cough).</p> <p><u>Discussion</u></p> <p>Both LABAs and LAMAs, such as tiotropium, are important in the management of patients with confirmed, stable COPD who continue to have respiratory symptoms (e.g., dyspnea, cough). We recommend tiotropium (a LAMA) as first-line maintenance therapy (in addition to SABA for rescue therapy) because this medication is more effective than LABAs as a group in preventing COPD exacerbations and COPD-related hospitalizations with fewer serious adverse events. LAMAs (specifically tiotropium) have been shown to improve FEV1 and QoL and to prevent moderate to severe exacerbations in patients with confirmed, stable COPD who continue to have respiratory symptoms, despite the use of as-needed short-acting bronchodilators. [82] Compared to LABAs as a group, tiotropium reduces the frequency of COPD exacerbations.</p> <p>However, this is a weak recommendation because there is no difference in all-cause hospitalization rates, mortality, symptom improvement, and FEV1 between tiotropium and LABAs. [85] The confidence in the available evidence is moderate, and the benefits-harm balance may slightly favor tiotropium over LABAs as first-line</p>

	<p>therapy. Further harm-benefit or cost-benefit analysis research is needed to compare these two medication classes.</p> <p>Evidence⁶:</p> <p>82.Karner C, Chong J, Poole P. Tiotropium versus placebo for chronic obstructive pulmonary disease. <i>Cochrane Database Syst Rev</i>. 2012;7:Cd009285.</p> <p>85.Chong J, Karner C, Poole P. Tiotropium versus long-acting beta-agonists for stable chronic obstructive pulmonary disease. <i>Cochrane Database Syst Rev</i>. 2012;9:Cd009157.</p> <p>GRADE Strength of Recommendation: weak for</p> <p>6 For new recommendations, developed by the 2014 guideline Work Group, the literature cited corresponds directly to the 2014 evidence review. This can include articles that were captured as part of an included study (e.g., an RCT that was included in a systematic review). For new recommendations which did not cite evidence identified through the systematic evidence review, “additional evidence” is listed. These are studies that support the recommendation, but which were not systematically identified through a literature review. For recommendations that have been carried over from the 2007 VA/DoD COPD CPG, slight modifications were made to the language in order to better reflect the current evidence and/or the change in grading system used for assigning the strength of each recommendation (USPSTF to GRADE). For these “modified” recommendations, the evidence column indicates “additional evidence,” which can refer to relevant studies that support the recommendation, but which were not systematically identified through a literature review.</p>
Institute for Clinical Systems Improvement (ICSI), 2016 [20]. Diagnosis and Management of Chronic Obstructive Pulmonary Disease (COPD)	<p>Fragestellung</p> <p>Siehe “Management of Chronic Obstructive Pulmonary Disease Working Group. 2014 [25]”</p> <p>Methodik</p> <p>ICSI has endorsed with qualifications the Veteran’s Affairs/Department of Defense (VA/DoD) Clinical Practice Guideline for the Management of Chronic Obstructive Pulmonary Disease. Using the ICSI endorsement process, this document has been reviewed by the ICSI COPD work group.</p> <p>Literature Search</p> <p>The VA/DoD literature search covered the time period from January 1, 2005 to February 2014. ICSI replicated this search to include January 2014 – February 2015.</p> <p>Additional articles were provided by work group members and discussed by the work group prior to inclusion.</p> <p>GRADE Methodology</p> <p>Following a review of several evidence rating and recommendation writing systems, ICSI has made a decision to transition to the Grading of Recommendations Assessment, Development and Evaluation (GRADE) system.</p>
