EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2. Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2. Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Median	66.67	0.00			66.67	0.00
Min, Max	66.7, 66.7	0.0, 0.0			66.7, 66.7	0.0, 0.0

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2. Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Min, Max	93.3, 93.3	13.3, 13.3	86.7, 86.7	33.3, 33.3	86.7, 93.3	13.3, 33.3

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2. Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning. Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2. Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Summary of Actual Values and Change from Baseline in EORTC QLQ-C30 Scores Functional Scales During Treatment Period 1 and Period 2 and Long Term Extension by the Randomization Stratification Factors of Screening Hgb Level (< 8.5 and ≥ 8.5 g/dL) Modified Randomized Set

Global Health Status/QoL

Screening Hgb Level < 8.5 g/dL

Visit/Statistics	D->D (N=35)		P->D (N=15)		Total (N=50)	
	Actual Value	Change from Baseline	Actual Value	Change from Baseline	Actual Value	Change from Baseline
Baseline						
n	35		15		50	
Mean (SD)	56.43 (20.220)		57.22 (19.124)		56.67 (19.706)	
Median	58.33		58.33		58.33	
Min, Max	16.7, 91.7		16.7, 91.7		16.7, 91.7	
Week 2						
n	35	35	15	15		
Mean (SD)	63.57 (17.160)	7.14 (17.403)	59.44 (12.936)	2.22 (19.787)		
Median	66.67	8.33	58.33	0.00		
Min, Max	33.3, 100.0	-41.7, 41.7	41.7, 83.3	-25.0, 50.0		

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Min, Max	40.0, 100.0	-6.7, 60.0	26.7, 100.0	-6.7, 33.3		

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Summary of Actual Values and Change from Baseline in EORTC QLQ-C30 Scores Functional Scales During Treatment Period 1 and Period 2 and Long Term Extension by the Randomization Stratification Factors of Screening Hgb Level (< 8.5 and ≥ 8.5 g/dL) Modified Randomized Set

Global Health Status/QoL

Screening Hgb Level ≥ 8.5 g/dL

Visit/Statistics	D->D (N=22)		P->D (N=11)		Total (N=33)	
	Actual Value	Change from Baseline	Actual Value	Change from Baseline	Actual Value	Change from Baseline
Week 104						
n	2	2	1	1	3	3
Mean (SD)	79.17 (29.463)	0.00 (0.000)	83.33 (NA)	41.67 (NA)	80.56 (20.972)	13.89 (24.056)
Median	79.17	0.00	83.33	41.67	83.33	0.00
Min, Max	58.3, 100.0	0.0, 0.0	83.3, 83.3	41.7, 41.7	58.3, 100.0	0.0, 41.7

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Median	100.00	0.00	66.67	-8.33		
Min, Max	33.3, 100.0	-33.3, 33.3	0.0, 100.0	-33.3, 0.0		

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2. Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2. Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2. Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Mean (SD)	100.00 (NA)	33.33 (NA)			100.00 (NA)	33.33 (NA)
Median	100.00	33.33			100.00	33.33
Min, Max	100.0, 100.0	33.3, 33.3			100.0, 100.0	33.3, 33.3

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2. Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Min, Max	33.3, 100.0	-25.0, 58.3	33.3, 100.0	-33.3, 25.0		

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Median	100.00	0.00	83.33	58.33	100.00	16.67
Min, Max	66.7, 100.0	-33.3, 33.3	66.7, 100.0	50.0, 66.7	66.7, 100.0	-33.3, 66.7

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2. Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2. Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2. Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2. Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional sex variable and sex by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional sex variable and sex by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional age variable and age by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional age variable and age by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional region variable and region by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional region variable and region by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional region variable and region by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional transfusion history variable and transfusion history by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional transfusion history variable and transfusion history by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional screening Hgb level variable and screening Hgb level by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional screening Hgb level variable and screening Hgb level by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional background C5 inhibitor therapy variable and background C5 inhibitor therapy by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional background C5 inhibitor therapy variable and background C5 inhibitor therapy by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional Japanese patients variable and Japanese patients by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional Japanese patients variable and Japanese patients by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional race variable and race by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional race variable and race by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional race variable and race by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional race variable and race by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Table GERMANY.2.5.10.9

Change from Baseline in EORTC QLQ-C30 Scores Functional Scales During 12-Week of Treatment Period 1 by Race
Analysis Using a Mixed Model for Repeated Measures (MMRM)
Modified Randomized Set

Social Functioning

Subgroup by treatment interaction p-value	0.0002
---	--------

EORTC QLQ-C30 is European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 Scale. Functional scales include global health status/QoL, physical functioning, role functioning, emotional functioning, cognitive functioning and social functioning.

Each subscale has a range of 0 - 100%. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high level of functioning but a high score for a symptom scale represents a high level of symptomatology/problem.

LS=Least squares; CI=Confidence Interval; SEM=Standard error of the LS mean.

The difference of LS Means is calculated as the Danicopan mean minus Placebo mean.

Estimates are based on an MMRM that includes fixed, categorical effects of treatment group, study visit, and study visit by treatment group interaction as well as the continuous, fixed covariate of baseline EORTC QLQ-C30 score value and the randomization stratification factors of transfusion history (> 2 or ≤ 2 transfusions within 6 months of Screening) and screening Hgb (< 8.5 g/dL or ≥ 8.5 g/dL).

P-value is from difference of LSM from MMRM model. Interaction test p-value is from the same MMRM model with additional race variable and race by treatment interaction term.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Table GERMANY.3.1.3.1.5
Overview of Treatment-Emergent Adverse Events for Treatment Period 1 by the Randomization Stratification Factors of Transfusion History (> 2 or ≤ 2 Transfusions During 6 Months Prior to Screening) Safety Set

	Danicopan (N=57) n (%) (95% CI)	Placebo (N=29) n (%) (95% CI)	RR (95% CI)	OR (95% CI)	RD (95% CI)	p-value [a]	B-D test p-value [b]
Any Adverse Event (AE)							0.0789
≤2 (N=50)	m=33 27 (81.8) (64.5, 93.0)	m=17 9 (52.9) (27.8, 77.0)	1.55 (1.00, 3.21)	4.00 (0.90, 17.93)	0.29 (0.00, 0.56)	0.0470	
>2 (N=36)	m=24 16 (66.7) (44.7, 84.4)	m=12 9 (75.0) (42.8, 94.5)	0.89 (0.56, 1.59)	0.67 (0.09, 3.83)	-0.08 (-0.38, 0.27)	0.7148	

TEAE = Treatment-emergent adverse event, m = number of patients in each subgroup and treatment group, % = n/m*100 , RR = Relative Risk, OR = Odds Ratio, RD = Risk Difference.

TEAE that has a starting date occurred during a certain Treatment Period is regarded as TEAE at that Treatment Period. Any TEAEs lasted across treatment periods are only counted once in the treatment period the event started.

Grade 1=mild; Grade 2=moderate; Grade 3=severe; Grade 4=life-threatening; Grade 5=Fatal

AEs are coded using MedDRA version 25.1.

[a] P-value is from the fisher exact test for treatment comparison. [b] P-value is from the Breslow-Day test of homogeneity of odds ratios for subgroup. The 95% CI for each treatment group is computed by Clopper-Pearson method. Exact unconditional approach is used for calculating the 95% CI for RD, RR and OR.

The summary by subgroup is performed with at least 10 patients in each subgroup and at least 10 patients with the event in at least one subgroup.

Table GERMANY.3.1.3.2.1.1
Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term for Treatment Period 1
Safety Set

System Organ Class (SOC) Preferred Term (PT)	Danicopan (N=57) n (%) (95% CI)	Placebo (N=29) n (%) (95% CI)	RR (95% CI)	OR (95% CI)	RD (95% CI)	p-value
Musculoskeletal and connective tissue disorders	10 (17.5) (8.7, 29.9)	5 (17.2) (5.8, 35.8)	1.02 (0.39, 3.84)	1.02 (0.28, 4.25)	0.00 (-0.19, 0.17)	1.0000
Nervous system disorders	7 (12.3) (5.1, 23.7)	5 (17.2) (5.8, 35.8)	0.71 (0.24, 2.24)	0.67 (0.16, 2.99)	-0.05 (-0.25, 0.11)	0.5283
Headache	6 (10.5) (4.0, 21.5)	3 (10.3) (2.2, 27.4)	1.02 (0.27, 7.56)	1.02 (0.20, 6.80)	0.00 (-0.18, 0.14)	1.0000
Psychiatric disorders	2 (3.5) (0.4, 12.1)	3 (10.3) (2.2, 27.4)	0.34 (0.03, 2.03)	0.32 (0.03, 2.97)	-0.07 (-0.24, 0.05)	0.3300
Insomnia	1 (1.8) (0.0, 9.4)	3 (10.3) (2.2, 27.4)	0.17 (0.01, 1.63)	0.15 (0.00, 2.08)	-0.09 (-0.26, 0.02)	0.1093
Respiratory, thoracic and mediastinal disorders	7 (12.3) (5.1, 23.7)	2 (6.9) (0.8, 22.8)	1.78 (0.42, 16.97)	1.89 (0.33, 19.76)	0.05 (-0.11, 0.18)	0.7117
Vascular disorders	5 (8.8) (2.9, 19.3)	3 (10.3) (2.2, 27.4)	0.85 (0.20, 7.42)	0.83 (0.15, 5.79)	-0.02 (-0.19, 0.11)	1.0000

% = n/N*100, RR = Relative Risk, OR = Odds Ratio, RD = Risk Difference.

In summarizing n(%), if a patient had multiple events for a particular SOC or PT, he/she is counted only once for that SOC or PT.

TEAE that has a starting date occurred during a certain Treatment Period is regarded as TEAE at that Treatment Period. Any TEAEs lasted across treatment periods are only counted once in the treatment period the event started.

SOCs and PTs are sorted alphabetically.

SOCs and PTs were coded using MedDRA version 25.1.

P-value is from the fisher exact test for treatment comparison. The 95% CI for each treatment group is computed by Clopper-Pearson method. Exact unconditional approach is used for calculating the 95% CI for RD, RR and OR.

SOCs and PTs with at least 10% patients in a study arm, or in 10 patients in one treatment arm is summarized.

% = n/N*100, CI=Confidence Interval

In summarizing n(%), if a patient had multiple events for a particular SOC or PT, he/she is counted only once for that SOC or PT.

TEAE that has a starting date occurred during a certain Treatment Period are regarded as TEAE at that Treatment Period. Any TEAEs lasted across treatment periods is only counted once in the treatment period the event started.

SOCs and PTs are sorted alphabetically.

SOCs and PTs were coded using MedDRA version 25.1.

The 95% CI for each treatment group is computed by Clopper-Pearson method.

SOCs and PTs with at least 10% patients in a study arm, or in 10 patients in one treatment arm is summarized.

HRU is Resource Utilization Patient Questionnaire.

This questionnaire asks about health care services the patient may have received during the past month. Only How many times gone to an Emergency Room for treatment of PNH and How many times admitted to a Hospital for treatment of PNH were reported.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

HRU is Resource Utilization Patient Questionnaire.

This questionnaire asks about health care services the patient may have received during the past month. Only How many times gone to an Emergency Room for treatment of PNH and How many times admitted to a Hospital for treatment of PNH were reported.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

HRU is Resource Utilization Patient Questionnaire.

This questionnaire asks about health care services the patient may have received during the past month. Only How many times gone to an Emergency Room for treatment of PNH and How many times admitted to a Hospital for treatment of PNH were reported.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

This questionnaire asks about health care services the patient may have received during the past month. Only How many times gone to an Emergency Room for treatment of PNH and How many times admitted to a Hospital for treatment of PNH were reported.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

HRU is Resource Utilization Patient Questionnaire.

This questionnaire asks about health care services the patient may have received during the past month. Only How many times gone to an Emergency Room for treatment of PNH and How many times admitted to a Hospital for treatment of PNH were reported.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

HRU is Resource Utilization Patient Questionnaire.

This questionnaire asks about health care services the patient may have received during the past month. Only How many times gone to an Emergency Room for treatment of PNH and How many times admitted to a Hospital for treatment of PNH were reported.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

This questionnaire asks about health care services the patient may have received during the past month. Only How many times gone to an Emergency Room for treatment of PNH and How many times admitted to a Hospital for treatment of PNH were reported.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

HRU is Resource Utilization Patient Questionnaire.

This questionnaire asks about health care services the patient may have received during the past month. Only How many times gone to an Emergency Room for treatment of PNH and How many times admitted to a Hospital for treatment of PNH were reported.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

HRU is Resource Utilization Patient Questionnaire.

This questionnaire asks about health care services the patient may have received during the past month. Only How many times gone to an Emergency Room for treatment of PNH and How many times admitted to a Hospital for treatment of PNH were reported.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

HRU is Resource Utilization Patient Questionnaire.

This questionnaire asks about health care services the patient may have received during the past month. Only How many times gone to an Emergency Room for treatment of PNH and How many times admitted to a Hospital for treatment of PNH were reported.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

HRU is Resource Utilization Patient Questionnaire.

This questionnaire asks about health care services the patient may have received during the past month. Only How many times gone to an Emergency Room for treatment of PNH and How many times admitted to a Hospital for treatment of PNH were reported.

Patients were randomized to Danicopan or Placebo for 12 weeks as Treatment Period 1. At Week 12, patients randomized to Placebo were switched to Danicopan for an additional 12 weeks as Treatment Period 2 and patients randomized to Danicopan continued on Danicopan during Treatment Period 2. At the end of the Treatment Period 2 (Week 24), patients entered the Long Term Extension (LTE) Period and continue to receive Danicopan.

D->D: Danicopan at Treatment Period 1 and Danicopan at Treatment Period 2; P->D: Placebo at Treatment Period 1 and Danicopan at Treatment Period 2.

Change from baseline is summarized only for patients who have data at baseline and the specified time point.

Baseline is defined as the last non-missing value prior to the first dose of study drug.

Actual values for Total group is summarized only for baseline and the time points from Long Term Extension (LTE).

No Records Meet the Criteria for this Table.

HRU is Resource Utilization Patient Questionnaire.
This questionnaire asks about health care services the patient may have received during the past month.
n = number of patients gone to an emergency room for treatment of PNH at week 12, % = n/N*100.
RR = Relative Risk, OR = Odds Ratio, RD = Risk Difference.
P-value is from the fisher exact test for treatment comparison.
95% CI for each treatment group is computed using Clopper-Pearson method. Exact unconditional approach is used for calculating the 95% CI for RD, RR and OR.

n	14	
Mean (SD)	39.3 (10.17)	
Median	42.0	
Min, Max	7.0, 48.0	

% = n/N*100. Treatment duration is derived as date of last dose - date of first dose + 1.

Treatment compliance based on actual danicopan dosage is defined as the total danicopan dose amount of received divided by the total danicopan dose amount of expected to be received by patient during the period. Treatment compliance based on tablet counts is defined as the total number of tablets received divided by the total number of tablets expected to be received by patient during the period. Compliance was calculated using available study drug accountability data.

Mean (SD)	371.5 (158.51)	362.9 (190.05)	369.2 (165.98)
Median	365.0	393.5	369.0
Min, Max	7.0, 666.0	30.0, 654.0	7.0, 666.0

Treatment duration is derived as date of last dose of Danicopan - date of first dose of Danicopan + 1.

For patients randomized to placebo group, only exposure duration to Danicopan was summarized.

N is number of patients who were exposed to Danicopan.
