N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
Only key visits up to Week 110 are displayed. An increase reflects a worsening of the status of the patient.
Results are presented in g/g.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
UP/C = urine protein/creatinine ratio.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
Only key visits up to Week 110 are displayed. An increase reflects a worsening of the status of the patient.
Results are presented in g/g.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
UP/C = urine protein/creatinine ratio.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
Only key visits up to Week 110 are displayed. An increase reflects a worsening of the status of the patient.
Results are presented in g/g.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
UP/C = urine protein/creatinine ratio.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
Only key visits up to Week 110 are displayed. An increase reflects a worsening of the status of the patient.
Results are presented in g/g.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
UP/C = urine protein/creatinine ratio.

Number of available records are presented for key visits up to Week 110 only. LS-Mean = Least square mean. 95% CI = 95% confidence interval. An increase reflects a worsening of the status of the patient. Results are presented in g/g. Analysis was performed on log-transformed data.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
UP/C = urine protein/creatinine ratio.

95% CI = 95% confidence interval for Hedges G. Only key visits up to Week 110 are displayed.
An increase reflects a worsening of the status of the patient. Results are presented in g/day.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 110 are included in the model. Only key visits up to Week 110 are displayed. A first order regressive covariance structure was used.
An increase reflects a worsening of the status of the patient. Results are presented in g/day.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 110 are included in the model. Only key visits up to Week 110 are displayed. A first order regressive covariance structure was used.
An increase reflects a worsening of the status of the patient. Results are presented in g/day.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 110 are included in the model. Only key visits up to Week 110 are displayed. A first order regressive covariance structure was used.
An increase reflects a worsening of the status of the patient. Results are presented in g/day.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

Study: PROTECT
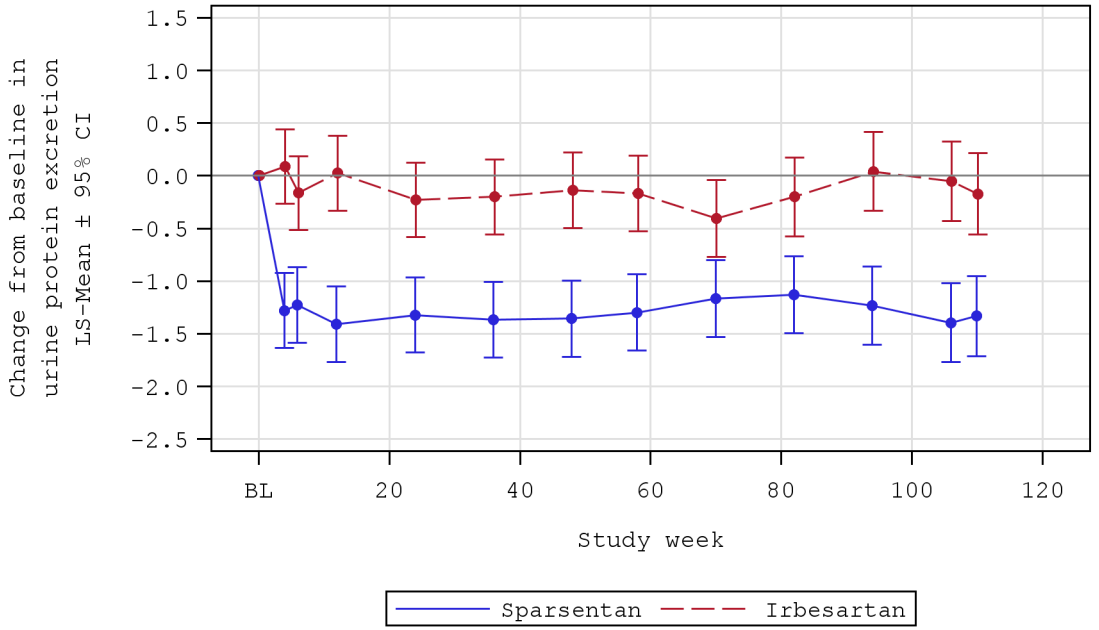
Baseline urine protein excretion: > 1.75 g/day



Sparsentan	100	100	95	84
Irbesartan	105	100	96	80

Number of available records are presented for key visits up to Week 110 only. LS-Mean = Least square mean. 95% CI = 95% confidence interval. An increase reflects a worsening of the status of the patient. Results are presented in g/day.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
Reference table: PT2UEC_FSCM

95% CI = 95% confidence interval (RR/OR: Wald, RD: Newcombe method). Percentages are based on number of evaluable values.
p-value = exact test of Fisher. * = significant treatment effect. p-value interaction = Cochran's Q. # = significant interaction.
RR = relative risk. OR = odds ratio. RD = risk difference. + = adding of 0.5 to each cell. NE = not evaluable.
Complete remission means an urinary protein excretion of <0.3 g/day.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 110 are included in the model. Only key visits up to Week 110 are displayed. A first order regressive covariance structure was used.
A decrease reflects a worsening of the status of the patient. Results are presented in ml/min/1.73 m**2.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 110 are included in the model. Only key visits up to Week 110 are displayed. A first order regressive covariance structure was used.
A decrease reflects a worsening of the status of the patient. Results are presented in ml/min/1.73 m**2.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. MRCM = Mixed Random Coefficient Model.
An MRCM was applied including treatment, time, randomization strata, baseline (as covariate), and interaction term treatment-by-time, random intercept and random slope per subject. For interaction test, subgroup and interaction subgroup*treatment were added to the model.
All observed post-baseline values up to Week 110 are included in the model. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
A decrease reflects a worsening of the status of the patient. Results are presented in ml/min/1.73 m**2. eGFR = estimated glomerular filtration rate. A first order autoregressive covariance structure was used.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. MRCM = Mixed Random Coefficient Model.
An MRCM was applied including treatment, time, randomization strata, baseline (as covariate), and interaction term treatment-by-time, random intercept and random slope per subject. For interaction test, subgroup and interaction subgroup*treatment were added to the model.
All observed post-baseline values from Week 6 up to Week 58 are included in the model. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
A decrease reflects a worsening of the status of the patient. Results are presented in ml/min/1.73 m**2. eGFR = estimated glomerular filtration rate. A first order autoregressive covariance structure was used.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. MRCM = Mixed Random Coefficient Model.
An MRCM was applied including treatment, time, randomization strata, baseline (as covariate), and interaction term treatment-by-time, random intercept and random slope per subject. For interaction test, subgroup and interaction subgroup*treatment were added to the model.
All observed post-baseline values from Week 6 up to Week 58 are included in the model. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
A decrease reflects a worsening of the status of the patient. Results are presented in ml/min/1.73 m**2. eGFR = estimated glomerular filtration rate. A first order autoregressive covariance structure was used.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

Table PT2GGLB_FSRM: Rate of change in eGFR (chronic slope) - Year 2 by subgroup
Full Analysis Set

Rate of change in eGFR (chronic slope) - year 2				Mixed Random Coefficient Model					
				Annualized Slope		Slope Difference			
Subgroup	Time	Treatment	N	LS-Mean (STE)	95% CI	LS-Mean (STE)	95% CI	p-value	
Time since renal biopsy	Overall	Sparsentan					Interaction:	0.079	
<= 5 years	Week 6 to Week 110	Sparsentan	113	-2.49 (0.63)	(-3.72, -1.25)	1.75 (0.87)	(0.02, 3.47)	0.047	*
		Irbesartan	127	-4.23 (0.61)	(-5.43, -3.04)				
> 5 years	Week 6 to Week 110	Sparsentan	89	-3.42 (0.52)	(-4.44, -2.40)	0.75 (0.78)	(-0.79, 2.29)	0.338	
		Irbesartan	75	-4.17 (0.58)	(-5.32, -3.02)				

N = number of patients in analysis set. LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. MRCM = Mixed Random Coefficient Model.
An MRCM was applied including treatment, time, randomization strata, baseline (as covariate), and interaction term treatment-by-time, random intercept and random slope per subject. For interaction test, subgroup and interaction subgroup*treatment were added to the model.
All observed post-baseline values from Week 6 up to Week 110 are included in the model. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
A decrease reflects a worsening of the status of the patient. Results are presented in ml/min/1.73 m**2. eGFR = estimated glomerular filtration rate. A first order autoregressive covariance structure was used.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
VAS = visual analogue scale.

		Irbesartan	107	63 (58.9)	3.61 (1.46)	(0.74, 6.48)			

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values are included. A first order regressive covariance structure was used.
A decrease reflects a worsening of the status of the patient. eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day. eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index. VAS = visual analouge scale.

	Irbesartan	75	11 (14.7)	118.1	(NE, NE)			

N = number of patients in analysis set. nev (%) = number of patients with at least one event. NE = not evaluable.
95% CI = 95% confidence interval (median: Brookmeyer/Crowley hazard ratio: coming from Cox model).
A Cox proportional model was applied with factors treatment, randomization strata and baseline as covariate.
* = significant treatment effect. # = significant interaction. For interaction test, subgroup and interaction subgroup*treatment was added to the model.
A decrease reflects a worsening of the status of the patient. Time is presented in weeks.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values are included. A first order regressive covariance structure was used.
A decrease reflects a worsening of the status of the patient. eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day. eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

	Irbesartan	25	7 (28.0)	NE				

N = number of patients in analysis set. nev (%) = number of patients with at least one event. NE = not evaluable.
95% CI = 95% confidence interval (median: Brookmeyer/Crowley hazard ratio: coming from Cox model).
A Cox proportional model was applied with factors treatment, randomization strata and baseline as covariate.
* = significant treatment effect. # = significant interaction. For interaction test, subgroup and interaction subgroup*treatment was added to the model.
A decrease reflects a worsening of the status of the patient. Time is presented in weeks.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values are included. A first order regressive covariance structure was used.
A decrease reflects a worsening of the status of the patient. eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day. eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values are included. A first order regressive covariance structure was used.
A decrease reflects a worsening of the status of the patient. eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day. eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values are included. A first order regressive covariance structure was used.
A decrease reflects a worsening of the status of the patient. eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day. eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values are included. A first order regressive covariance structure was used.
A decrease reflects a worsening of the status of the patient. eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day. eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

95% CI = 95% confidence interval (median: Brookmeyer/Crowley hazard ratio: coming from Cox model).
A Cox proportional model was applied with factors treatment, randomization strata and baseline as covariate.
* = significant treatment effect. # = significant interaction. For interaction test, subgroup and interaction subgroup*treatment was added to the model.
A decrease reflects a worsening of the status of the patient. Time is presented in weeks.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
PCS = physical component summary.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
PCS = physical component summary.

N = number of patients in analysis set. nev (%) = number of patients with at least one event. NE = not evaluable.
95% CI = 95% confidence interval (median: Brookmeyer/Crowley hazard ratio: coming from Cox model).
A Cox proportional model was applied with factors treatment, randomization strata and baseline as covariate.
* = significant treatment effect. # = significant interaction. For interaction test, subgroup and interaction subgroup*treatment was added to the model.
A decrease reflects a worsening of the status of the patient. Time is presented in weeks.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
MCS = mental component summary.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
MCS = mental component summary.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
MCS = mental component summary.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
MCS = mental component summary.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values are included. A first order regressive covariance structure was used.
A decrease reflects a worsening of the status of the patient. eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day. eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index. MCS = mental component summary.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values are included. A first order regressive covariance structure was used.
A decrease reflects a worsening of the status of the patient. eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day. eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index. MCS = mental component summary.

Table PT2AEIN_SSIM: Incidence of AESI acute kidney injury during double-blind period – non-severe by subgroup
Safety Set

AESI acute kidney injury - non-severe

Subgroup	Time	Treatment	N	n (%)	RR [95 % CI]	OR [95 % CI]	RD [95 % CI]	p-value
Baseline use of antihypertensives	Double-blind period	Sparsentan					Interaction test:	NE
Yes	Double-blind period	Sparsentan	90	4 (4.4) all n<10				NE
		Irbesartan	88	4 (4.5)				
No	Double-blind period	Sparsentan	112	4 (3.6) all n<10				NE
		Irbesartan	114	1 (0.9)				

Notes: Due to different lengths of observation periods, incidences between primary and final analysis are not comparable.
N = number of patients in analysis set. n = number of patients with event. AESI = adverse event of special interest.
95% CI = 95% confidence interval (RR/OR: Wald, RD: Newcombe method).
p-value = exact test of Fisher. * = significant treatment effect. p-value interaction = Cochran's Q. # = significant interaction.
RR = relative risk. OR = odds ratio. RD = risk difference. + = adding of 0.5 to each cell. NE = not evaluable.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
