Dossier zur Nutzenbewertung gemäß § 35a SGB V

Sparsentan (Filspari™)

Vifor Pharma Deutschland GmbH

Separater Anhang 4-G

Erwachsene Patienten mit primärer Immunglobulin-A-Nephropathie (IgAN) mit einer Ausscheidung von Eiweiß im Urin von ≥ 1,0 g/Tag (oder einem Protein/Kreatinin-Quotienten im Urin von ≥ 0,75 g/g)

Medizinischer Nutzen und
medizinischer Zusatznutzen,
Patientengruppen mit therapeutisch
bedeutsamem Zusatznutzen

Stand: 31.07.2024

Week 36	Sparsentan	202	139 (68.8)	-48.18	(-53.00, -42.88)	0.613	(0.534, 0.705)	<0.001	*
	Irbesartan	202	132 (65.3)	-15.52	(-23.46, -6.76)				
Week 58	Sparsentan	202	113 (55.9)	-46.34	(-51.83, -40.22)	0.632	(0.541, 0.739)	<0.001	*
	Irbesartan	202	99 (49.0)	-15.16	(-24.20, -5.03)				

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. Analysis was performed using the natural logarithm of the dependent variable. Reported estimates are back-transformed to the ratio scale.
LS-Mean = Least square mean. 95% CI = 95% confidence interval. * = significant treatment effect. Only key visits up to Week 58 are displayed.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and log(baseline) as covariate.
All observed values up to Week 58 are included in the model.
An increase reflects a worsening of the status of the patient. Results are presented in g/g. UP/C = urine protein/creatinine ratio.
A first order autoregressive covariance structure was used.
Estimated LS Mean and 95% CIs were converted to percentage change as follows: [exp(least squares mean change from baseline in natural log(UP/C)) – 1] x 100. The Ratio (Sparsentan/Irbesartan) can be interpreted in an analogous way as a other common summarizing ratios (e.g. RR).

	Irbesartan	202	-4.92 (0.96)	(-6.80, -3.03)			

N = number of patients in analysis set. LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. MRCM = Mixed Random Coefficient Model.
An MRCM was applied including treatment, time, randomization strata, baseline (as covariate), and interaction term treatment-by-time, random intercept and random slope per subject.
All observed values up from Week 6 to Week 58 are included in the model. A first order autoregressive covariance structure was used.
A decrease reflects a worsening of the status of the patient. Results are presented in ml/min/1.73 m**2. eGFR = estimated glomerular filtration rate.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate.
A decrease reflects a worsening of the status of the patient.
A first order regressive covariance structure was used.

KDQOL-SF12: time to decrease in MCS by at least 9.0			Kaplan-Meier analysis		Cox regression		
Treatment	N	nev (%)	Median time (weeks)	95% CI	Hazard Ratio	95% CI	p-value
Sparsentan	202	34 (16.8)	111.1	(96.1, 114.3)	1.409	(0.808, 2.455)	0.227
Irbesartan	202	22 (10.9)	NE				

N = number of patients in analysis set. nev (%) = number of patients with at least one event. NE = not evaluable. * = significant treatment effect.
95% CI = 95% confidence interval (median: Brookmeyer/Crowley hazard ratio: coming from Cox model).
A Cox proportional model was applied with factors treatment, randomization strata and baseline as covariate.
A decrease reflects a worsening of the status of the patient. Time is presented in weeks.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. Analysis was performed using the natural logarithm of the dependent variable. Reported estimates are back-transformed to the ratio scale. LS-Mean = Least square mean. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. Only key visits up to Week 56 are displayed.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and log(baseline) as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment were added to the model. All observed values up to Week 58 are included in the model.
An increase reflects a worsening of the status of the patient. Results are presented in g/g. Estimated LS Mean and 95% CIs were converted to percentage change as follows: [exp(least squares mean change from baseline in natural log(UP/C)) – 1] x 100. The Ratio (Sparsentan/Irbesartan) can be interpreted in an analogous way as other common summarizing ratios (e.g. RR).
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
UP/C = urine protein/creatinine ratio. A first order autoregressive covariance structure was used.

		Irbesartan	107	58 (54.2)	-3.84	(-17.23, 11.71)			

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. Analysis was performed using the natural logarithm of the dependent variable. Reported estimates are back-transformed to the ratio scale. LS-Mean = Least square mean. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. Only key visits up to Week 56 are displayed.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and log(baseline) as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment were added to the model. All observed values up to Week 58 are included in the model.
An increase reflects a worsening of the status of the patient. Results are presented in g/g. Estimated LS Mean and 95% CIs were converted to percentage change as follows: [exp(least squares mean change from baseline in natural log(UP/C)) – 1] x 100. The Ratio (Sparsentan/Irbesartan) can be interpreted in an analogous way as other common summarizing ratios (e.g. RR).
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
UP/C = urine protein/creatinine ratio. A first order autoregressive covariance structure was used.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. Analysis was performed using the natural logarithm of the dependent variable. Reported estimates are back-transformed to the ratio scale. LS-Mean = Least square mean. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. Only key visits up to Week 56 are displayed.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and log(baseline) as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment were added to the model. All observed values up to Week 58 are included in the model.
An increase reflects a worsening of the status of the patient. Results are presented in g/g. Estimated LS Mean and 95% CIs were converted to percentage change as follows: [exp(least squares mean change from baseline in natural log(UP/C)) – 1] x 100. The Ratio (Sparsentan/Irbesartan) can be interpreted in an analogous way as other common summarizing ratios (e.g. RR).
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
UP/C = urine protein/creatinine ratio. A first order autoregressive covariance structure was used.

95% CI = 95% confidence interval for Hedges G. Only key visits up to Week 58 are displayed.
An increase reflects a worsening of the status of the patient. Results are presented in g/day.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. Only key visits up to Week 58 are displayed.
An increase reflects a worsening of the status of the patient. Results are presented in g/day.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. Only key visits up to Week 58 are displayed.
An increase reflects a worsening of the status of the patient. Results are presented in g/day.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. Only key visits up to Week 58 are displayed.
An increase reflects a worsening of the status of the patient. Results are presented in g/day.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. A first order regressive covariance structure was used.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 58 are included in the model. Only key visits up to Week 58 are displayed.
An increase reflects a worsening of the status of the patient. Results are presented in g/day.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. A first order regressive covariance structure was used.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 58 are included in the model. Only key visits up to Week 58 are displayed.
An increase reflects a worsening of the status of the patient. Results are presented in g/day.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. Only key visits up to Week 58 are displayed.
A decrease reflects a worsening of the status of the patient. Results are presented in ml/min/1.73 m**2.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
95% CI = 95% confidence interval for Hedges G. Only key visits up to Week 58 are displayed.
A decrease reflects a worsening of the status of the patient. Results are presented in ml/min/1.73 m**2.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. A first order regressive covariance structure was used.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 58 are included in the model. Only key visits up to Week 58 are displayed.
A decrease reflects a worsening of the status of the patient. Results are presented in ml/min/1.73 m**2.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. MRCM = Mixed Random Coefficient Model.
An MRCM was applied including treatment, time, randomization strata, baseline (as covariate), and interaction term treatment-by-time, random intercept and random slope per subject. For interaction test, subgroup and interaction subgroup*treatment were added to the model.
All observed post-baseline values from Week 6 up to Week 58 are included in the model. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
A decrease reflects a worsening of the status of the patient. Results are presented in ml/min/1.73 m**2. eGFR = estimated glomerular filtration rate. A first order autoregressive covariance structure was used.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

A negative binomial model was applied with factors treatment, randomisation strata, and log of offset. The study duration of double blind period was used as offset. Randomisation stratum will be included only once in the model, if this stratum is investigated subgroup.
* = significant treatment effect. # = significant interaction.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. nev (%) = number of patients with at least one event. NE = not evaluable.
95% CI = 95% confidence interval (median: Brookmeyer/Crowley hazard ratio: coming from Cox model).
A Cox proportional model was applied with factors treatment, randomization strata and baseline as covariate.
* = significant treatment effect. # = significant interaction. For interaction test, subgroup and interaction subgroup*treatment was added to the model.
A decrease reflects a worsening of the status of the patient. Time is presented in weeks.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. NE= Not evaluable.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. A first order regressive covariance structure was used.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 58 are included in the model and also presented.
A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. NE= Not evaluable.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. A first order regressive covariance structure was used.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 58 are included in the model and also presented.
A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. NE= Not evaluable.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. A first order regressive covariance structure was used.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 58 are included in the model and also presented.
A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

	Irbesartan	119	11 (9.2)	NE				

N = number of patients in analysis set. nev (%) = number of patients with at least one event. NE = not evaluable.
95% CI = 95% confidence interval (median: Brookmeyer/Crowley hazard ratio: coming from Cox model).
A Cox proportional model was applied with factors treatment, randomization strata and baseline as covariate.
* = significant treatment effect. # = significant interaction. For interaction test, subgroup and interaction subgroup*treatment was added to the model.
A decrease reflects a worsening of the status of the patient. Time is presented in weeks.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

		Irbesartan	59	22 (37.3)	-2.85 (2.75)	(-8.30, 2.59)			

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. NE= Not evaluable.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. A first order regressive covariance structure was used.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 58 are included in the model and also presented.
A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. NE= Not evaluable.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. A first order regressive covariance structure was used.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 58 are included in the model and also presented.
A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

N = number of patients in analysis set. nev (%) = number of patients with at least one event. NE = not evaluable.
95% CI = 95% confidence interval (median: Brookmeyer/Crowley hazard ratio: coming from Cox model).
A Cox proportional model was applied with factors treatment, randomization strata and baseline as covariate.
* = significant treatment effect. # = significant interaction. For interaction test, subgroup and interaction subgroup*treatment was added to the model.
An increase reflects an improvement of the status of the patient. Time is presented in weeks.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

Table PT1KSYDT_FSTM: KDQOL: Time to decrease in symptom/problems of kidney disease by at least 15 points by subgroup
Full Analysis Set

KDQOL: Time to decrease in symptom/problems of kidney disease by at least 15				Kaplan-Meier analysis		Cox regression		
Subgroup	Treatment	N	nev (%)	Median time (weeks)	95% CI	Hazard Ratio	95% CI	p-value
Baseline use of antihypertensives	Sparsentan						Interaction test:	0.248
Yes	Sparsentan	88	10 (11.4)	NE		1.623	(0.548, 4.805)	0.382
	Irbesartan	83	5 (6.0)	NE				
No	Sparsentan	114	13 (11.4)	NE		0.766	(0.352, 1.666)	0.501
	Irbesartan	119	13 (10.9)	NE				

N = number of patients in analysis set. nev (%) = number of patients with at least one event. NE = not evaluable.
95% CI = 95% confidence interval (median: Brookmeyer/Crowley hazard ratio: coming from Cox model).
A Cox proportional model was applied with factors treatment, randomization strata and baseline as covariate.
* = significant treatment effect. # = significant interaction. For interaction test, subgroup and interaction subgroup*treatment was added to the model.
A decrease reflects a worsening of the status of the patient. Time is presented in weeks.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. A first order regressive covariance structure was used.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 58 are included in the model and also presented.
A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
PCS = physical component summary.

<= 1.75 g/day	Sparsentan	98	12 (12.2)	NE		1.157	(0.435, 3.080)	0.770
	Irbesartan	94	7 (7.4)	NE				
> 1.75 g/day	Sparsentan	104	13 (12.5)	NE		0.998	(0.418, 2.382)	0.996
	Irbesartan	108	11 (10.2)	NE				

N = number of patients in analysis set. nev (%) = number of patients with at least one event. NE = not evaluable.
95% CI = 95% confidence interval (median: Brookmeyer/Crowley hazard ratio: coming from Cox model).
A Cox proportional model was applied with factors treatment, randomization strata and baseline as covariate.
* = significant treatment effect. # = significant interaction. For interaction test, subgroup and interaction subgroup*treatment was added to the model.
A decrease reflects a worsening of the status of the patient. Time is presented in weeks.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

		Irbesartan	59	22 (37.3)	-4.64 (1.76)	(-8.13, -1.14)			

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. NE= Not evaluable.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. A first order regressive covariance structure was used.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model.
For interaction test, subgroup and interaction subgroup*treatment was added to the model. All observed values up to Week 58 are included in the model and also presented.
A decrease reflects a worsening of the status of the patient.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
MCS = mental component summary.

95% CI = 95% confidence interval (median: Brookmeyer/Crowley hazard ratio: coming from Cox model).
A Cox proportional model was applied with factors treatment, randomization strata and baseline as covariate.
* = significant treatment effect. # = significant interaction. For interaction test, subgroup and interaction subgroup*treatment was added to the model.
An increase reflects an improvement of the status of the patient. Time is presented in weeks.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

> 1.75 g/day	Sparsentan	104	15 (14.4)	114.3	(NE, NE)	1.260	(0.569, 2.793)	0.568
	Irbesartan	108	15 (13.9)	NE				

N = number of patients in analysis set. nev (%) = number of patients with at least one event. NE = not evaluable.
95% CI = 95% confidence interval (median: Brookmeyer/Crowley hazard ratio: coming from Cox model).
A Cox proportional model was applied with factors treatment, randomization strata and baseline as covariate.
* = significant treatment effect. # = significant interaction. For interaction test, subgroup and interaction subgroup*treatment was added to the model.
A decrease reflects a worsening of the status of the patient. Time is presented in weeks.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.

	Irbesartan	202	121 (59.9)	-1.85 (0.65)	(-3.12, -0.57)			

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures.
LS-Mean = Least square mean. STE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and baseline as covariate.
A decrease reflects a worsening of the status of the patient.
A first order regressive covariance structure was used.

Table PT2AC_SMS0: Incidence of severe TEAEs during double-blind period by SOC/PT
Safety Set

Not done. No valid soc/pt combination with sufficient high incidence found.

_____
Notes: Due to different lengths of observation periods, incidences between primary and final analysis are not comparable.
N = number of patients in analysis set. n = number of patients with event. TEAE = treatment emergent adverse event. SOC = system organ class. PT = preferred term.
95% CI = 95% confidence interval (RR/OR: Wald, RD: Newcombe method).
p-value = exact test of Fisher was used. * = significant treatment effect.
RR = relative risk. OR = odds ratio. RD = risk difference. + = adding of 0.5 to each cell. NE = not evaluable.
Only events are reported with at least 5% of affected patients in at least 1 treatment arm.
Source Data: aae, created on: 30JAN2024

Table PT2AD_SMSD: Incidence of fatal TEAEs during double-blind period by SOC/PT
Safety Set

Fatal TEAEs				
SOC/PT	Time	Treatment	N	n (%)
SOC: Cardiac disorders	Double-blind period	Sparsentan	202	0 (0.0)
		Irbesartan	202	1 (0.5)
PT: Cardio-respiratory arrest	Double-blind period	Sparsentan	202	0 (0.0)
		Irbesartan	202	1 (0.5)

Notes: Due to different lengths of observation periods, incidences between primary and final analysis are not comparable.
N = number of patients in analysis set. n = number of patients with event. TEAE = treatment emergent adverse event. SOC = system organ class. PT = preferred term.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. Analysis was performed using the natural logarithm of the dependent variable. Reported estimates are back-transformed to the ratio scale. LS-Mean = Least square mean. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. Only key visits up to Week 110 are displayed.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and log(baseline) as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment were added to the model. All observed values up to Week 110 are included in the model. An increase reflects a worsening of the status of the patient. Results are presented in g/g. Estimated LS Mean and 95% CIs were converted to percentage change as follows: [exp(least squares mean change from baseline in natural log(UP/C)) – 1] x 100. The Ratio (Sparsentan/Irbesartan) can be interpreted in an analogous way as other common summarizing ratios (e.g. RR).
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
UP/C = urine protein/creatinine ratio. A first order autoregressive covariance structure was used.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. Analysis was performed using the natural logarithm of the dependent variable. Reported estimates are back-transformed to the ratio scale. LS-Mean = Least square mean. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. Only key visits up to Week 110 are displayed.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and log(baseline) as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment were added to the model. All observed values up to Week 110 are included in the model. An increase reflects a worsening of the status of the patient. Results are presented in g/g. Estimated LS Mean and 95% CIs were converted to percentage change as follows: [exp(least squares mean change from baseline in natural log(UP/C)) – 1] x 100. The Ratio (Sparsentan/Irbesartan) can be interpreted in an analogous way as other common summarizing ratios (e.g. RR).
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
UP/C = urine protein/creatinine ratio. A first order autoregressive covariance structure was used.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. Analysis was performed using the natural logarithm of the dependent variable. Reported estimates are back-transformed to the ratio scale. LS-Mean = Least square mean. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. Only key visits up to Week 110 are displayed.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and log(baseline) as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment were added to the model. All observed values up to Week 110 are included in the model. An increase reflects a worsening of the status of the patient. Results are presented in g/g. Estimated LS Mean and 95% CIs were converted to percentage change as follows: [exp(least squares mean change from baseline in natural log(UP/C)) – 1] x 100. The Ratio (Sparsentan/Irbesartan) can be interpreted in an analogous way as other common summarizing ratios (e.g. RR).
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
UP/C = urine protein/creatinine ratio. A first order autoregressive covariance structure was used.

N = number of patients in analysis set. n (%) = number of non-missing values included in the model. MMRM = Mixed Model Repeated Measures. Analysis was performed using the natural logarithm of the dependent variable. Reported estimates are back-transformed to the ratio scale. LS-Mean = Least square mean. 95% CI = 95% confidence interval. * = significant treatment effect. # = significant interaction. Only key visits up to Week 110 are displayed.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time, randomization strata and log(baseline) as covariate. Baseline covariates/factors, which are part of considered subgroup, were excluded from the model. For interaction test, subgroup and interaction subgroup*treatment were added to the model. All observed values up to Week 110 are included in the model. An increase reflects a worsening of the status of the patient. Results are presented in g/g. Estimated LS Mean and 95% CIs were converted to percentage change as follows: [exp(least squares mean change from baseline in natural log(UP/C)) – 1] x 100. The Ratio (Sparsentan/Irbesartan) can be interpreted in an analogous way as other common summarizing ratios (e.g. RR).
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
UP/C = urine protein/creatinine ratio. A first order autoregressive covariance structure was used.

N = total number of patients in analysis set. n = number of evaluable values. SD = standard deviation. Q = quantile.
Only key visits up to Week 110 are displayed. An increase reflects a worsening of the status of the patient.
Results are presented in g/g.
eGFR Low = 30 - < 60 ml/min/1.73m**2, eGFR High >= 60 ml/min/1.73m**2, UP Low = <= 1.75 g/day, UP High = > 1.75 g/day.
eGFR = estimated glomerular filtration rate. UP = urine protein. IgAN = immunoglobulin A nephropathy. BMI = body mass index.
UP/C = urine protein/creatinine ratio.
Source Data: alb, created on: 19FEB2024

Table PT2RPR_FSHM: Course of UP/C (percentage) by subgroup
