Patients who died in platinum-based chemotherapy and completed at least 4 cycles of chemotherapy, had at least stable disease until end of treatment visit (INV) and had no progressive disease or died within 10 weeks after last dose of chemotherapy were imputed as having an event at date of death + avelumab OS advantage (7.0 months) or censored at data cutoff date if data cutoff date < date of death + avelumab OS advantage.

Note: The stratification factors are programmed cell death ligand-1 (PD-L1) expression (high [CPS>=10] or low [CPS<10]) and liver metastases (present or absent). If a subgroup is identified as a stratification factor, the models will only be controlled for the other stratification factor.

Complete response was defined as first confirmed complete response.

(a) Based on the Brookmeyer-Crowley Method; (b) Calculated from stratified Cox proportional hazards model; (c) Based on 2-sided stratified log-rank test, unadjusted for multiplicity; (d) Two-sided Type 3 Wald test p-value from Cox proportional hazards model including treatment, subgroup, and treatment x subgroup interaction.
